Lessons from the United States.

IN his presidential address to the I.M.E.A. on Tuesday last, Mr. R. B. Mitchell, finding little on this side of the Atlantic likely to form a cheerful subject, turned his mental vision westward, and told his audience what he had observed during his recent tour in the United States as a delegate to the I.E.C. Conference. An abstract of the address appears on a later page.

Naturally, Mr. Mitchell was impressed with the large sizes of the generating sets in vogue—conforming, of course, to the dimensions of the power stations; when a station is designed for an output of 400,000 kW, the most suitable size of set is in the neighbourhood of 50,000 kW, the number of sets installed being preferably between, say, 6 and 10. When, and where, a demand of this order exists, stations of corresponding magnitude must be erected; in the neighbourhood of Chicago an installation of 1,000,000 kW is contemplated, in which the generating sets will be rated at 100,000 kW each, but there is no justification on the score of economy, or of first cost, or otherwise for using any set of more than 50,000 kW capacity in this country. As Mr. Mitchell points out, the cost of stations per kilowatt installed is comparatively high in the United States, in spite of the use of large sets. We do not follow his suggestion that when interconnection becomes more general in this country larger sets will be required; it will always be cheaper to carry coal to the load centres than to transmit very large blocks of power over long distances, at the load factors which are conceivably attainable.

Mr. Mitchell was especially interested in the use of steam at very high pressure, which is being developed in America, the high-pressure turbines exhausting into the main steam ranges of plant working at ordinary pressures. As he points out, by this means the economic life of our existing plant may perhaps be extended at moderate cost; a saving of 7 per cent. of fuel is claimed for the system against which must be set the capital charges on the additional plant, probably of costly construction. The use of pulverised fuel he regards as inevitable when larger boilers are required. His reference to the completion of the plant at Lakeside, Milwaukee, is of special interest; this plant is of the type described in our issue of Sept. 11th, 1925, the invention of Mr. S. McEwen, A.R.S.M., in which pulverised coal is stripped of its volatiles by a stream of hot gas and is thus converted into pulverised coke, suit-

able for boiler firing. We pointed out in our issue of Aug. 21st, 1925, that this process offered the hope of utilising coal to the best advantage, including the recovery of the by-products.

Mr. Mitchell does well to dispel the impression that the price of electricity in the United States is materially less than in this country, and his references to the extent to which the ordinary consumer uses electricity in the household are interesting; but unfortunately he falls into the same error as the Weir Committee—that of comparing a most highly developed area (Chicago) with the whole of this country, in respect of energy consumed per head of population. If we reversed the process, we could claim that, as Sir Joseph Nall stated before Standing Committee C of the House of Commons on June 3rd, the urban district of Stretford has a consumption of nearly 800 kWh per head per annum—nearly double the rate of consumption in the whole of the United States; hence the latter is far behind this country in electrical development!

Very significant are Mr. Mitchell's comments on the extensive use of showrooms, the remarkable development of the hire-purchase system, and the attention given to the provision of service to the consumer. All these points, which he considers worthy of imitation, we have constantly pressed upon the notice of our readers as essential factors in the development of the domestic load. The enormous potentialities of that class of business have been recognised by American supply authorities, and are engaging the earnest attention of all progressive undertakings in this country. That is the most hopeful avenue not only to the prosperity of the electrical industries in general, but also to the cheapening of electricity all round, for it offers the best prospect for the improvement of load factor and the consequent reduction of distribution costs, which form by far the largest proportion of the total cost to the consumer, and are much more important than the cost of fuel.

A Domestic Campaign in the Autumn.

The news that a great campaign for developing the domestic load is being planned for next autumn and winter will be welcomed by the entire electrical industry. The immense scope for progress in this branch of electricity supply in the United Kingdom and the benefits that are bound to follow for all sections of manufacturing and installation work are some of the most prominent amongst our present ideas. What we have to do is to find a most attractive way of making an effective appeal to millions of householders. The British Electrical Development Association, maintaining its reputation for looking well ahead and preparing appropriate measures, has decided to carry out an extensive publicity campaign jointly with the Lighting Service Bureau of the Electric Lamp Manufacturers' Association. From October next until the following April this campaign will proceed under the title "Wiring the Homes of Britain." Its popular appeal will take the form of a competition feature offering prizes to non-electrical readers who will study advertisements published in newspapers and journals having an aggregate circulation of 14,000,000 copies, read a book that is being produced by B.E.D.A., and engage in a ballot, particulars of which will be published later in the year. When it is mentioned that the first prize will take the substantial form of a valuable electric house, that the second will be some hundreds of pounds' worth of electrical equipment, and that there will be many other prizes of less value, it will be gathered that the competition will be on such a scale as to be worthy of the organisations that are behind it. There will be conjoint local efforts by B.E.D.A. and E.L.M.A., local exhibition electric houses, meetings and so forth, all of which it is hoped, will excite widespread inquiring interest on the part of the public.

We need do no more at the moment than announce that the organisation of the work is proceeding, and that a very large amount of money is to be expended upon it from the lately-increased funds of B.E.D.A., supplemented by a handsome additional contribution by the Electric Lamp Manufacturers' Association.

A Matter of Price.

Elsewhere in this issue a contributor discusses whether "cheapness" in connection with electrical products and electrical service, in comparison with gas products and gas service, is not receiving too much attention. The superiority of electrical service in the home is one of the publicity man's biggest talking points, of course, but it must not be forgotten, when we appeal to the millions, that the amount of money in the householder's pocket has much to do in many cases with settling his final course of action. While there may be something to be said for our contributor's criticism, it would be idle to question the need for securing low selling prices without sacrificing efficiency of product, giving, at the same time, ample facility for securing prompt assistance with renewals at reasonable prices, and other service accommodation such as gas companies make a practice of giving. It is almost impossible to exaggerate the importance of service—using the word in its wider sense—whether it be that of an electricity department or that of a supplier of apparatus. We must give greater attention to the need for removing vexatious obstructions from the path of the consumer. The electrical way should be made the easy way.

The Railways and the Bill.

On Thursday last week Standing Committee C of the House of Commons accepted an amendment to the Electricity (Supply) Bill, exempting railway power stations operated by railway companies from inclusion in the scheme as "selected stations."

It is true that in most cases such stations are of 25-cycle frequency and are not suitable for immediate connection to stations of other frequencies, but that is a condition which, as we have pointed out, may prove to be only a temporary obstacle; moreover, the use of frequency-changers, though costly, and hardly justifiable in the case of stations of similar load factor, would be perfectly proper in this instance, for the combination of a heavy and continuous traction load with a public supply load is highly desirable.

We have expressed our regret that the Government has made no provision in this Bill to encourage and facilitate the electrification of our railways generally; and our regret is intensified by the apparent intention of the Government even to go out of its way to exclude the railways from the scheme, without obvious necessity. Sir Douglas Hogg, it is true, uttered a pious hope that the railways would some day be good enough to patronise the Central Electricity Board's establishments—but that sort of thing "cuts no ice."

What we wish to emphasise is that the omission of the railway load from the working of the scheme may be fatal to its economic operation, whereas the combination of the two classes of demand would render success practically a certainty.

Electrical Contractors at Brighton.

At the moment of going to press there is every reason to hope that in spite of the difficulties of the times, the first annual Convention of the Electrical Contractors' Association at Brighton will be well attended. The programme of papers and events, which was published in our issue of April 23rd, p. 679, will be adhered to. Delegates will assemble at the Royal Pavilion, Brighton, on Wednesday evening for the reception by the president, Mr. T. E. Alger, followed by a dance. On Thursday the delivery of the presidential address and two papers on "Co-operation and Apprenticeship" will form the more serious part of the proceedings, while on Friday the subjects to receive attention will be wiring rules and registration. With the large attendance of contractors that is expected, and with a table fully loaded with such substantial food for thought and discussion, the E.C.A. should be in for a profitable and enjoyable time.

Glasgow Corporation Electricity Supply.

Dalmarnock Generating Station Developments.

The Glasgow Corporation Electricity Department was inaugurated in 1890, the city in that year agreeing to acquire an undertaking with 300 kW of plant installed and about 30 consumers. By 1893 the Department had bought ground at Waterloo Street and built a new generating station there, which supplied direct current at 100/200 volts.

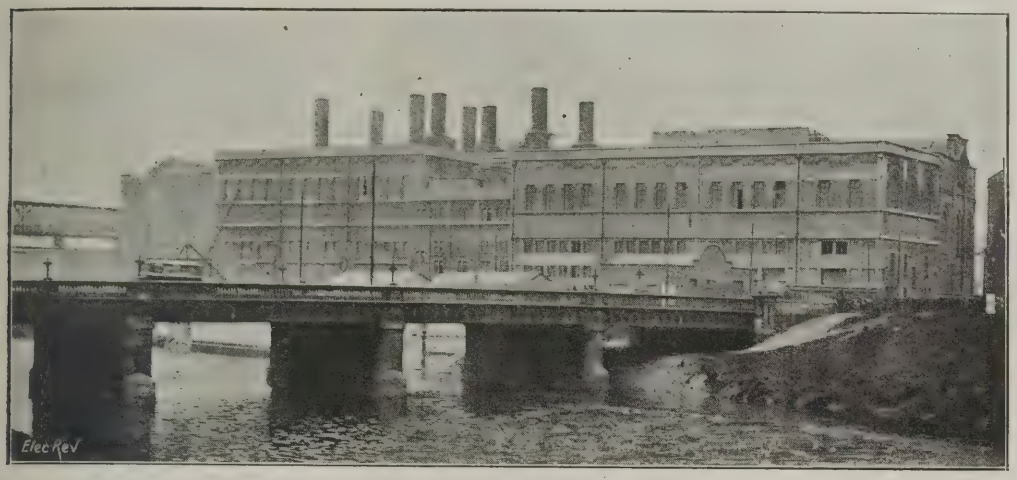

Fig. 1.—The Completed Building from Left Bank of Clyde.

It was soon realised that the demand for electricity would rapidly increase, and suitable sites for power stations were obtained at Port Dundas and Pollokshaws Road. Important installations, which served the city well, were erected at these points during the period when Mr. W. A. Chamen was the city electrical engineer. About that time the Board of Trade altered the regulations for public supply, and the city boldly adopted the pressure of 250/500 volts d.c.—the highest limit allowed. Mr. Chamen resigned in 1905, and was succeeded by Mr. W. W. Lackie, under whose energetic leadership the undertaking continued to make rapid progress until he accepted appointment as one of the Electricity Commissioners.

Mr. R. B. Mitchell, M.I.E.E., is the fourth ruler in the Glasgow electrical succession, and his reign, which commenced in 1920, is worthily marked by the growth of Dalmarnock, the fourth and by far the largest of the stations designed for the Electricity Department; it now carries the bulk of the city's demand for industrial power and lighting, and last winter the peak load of the station was 85,000 kW.

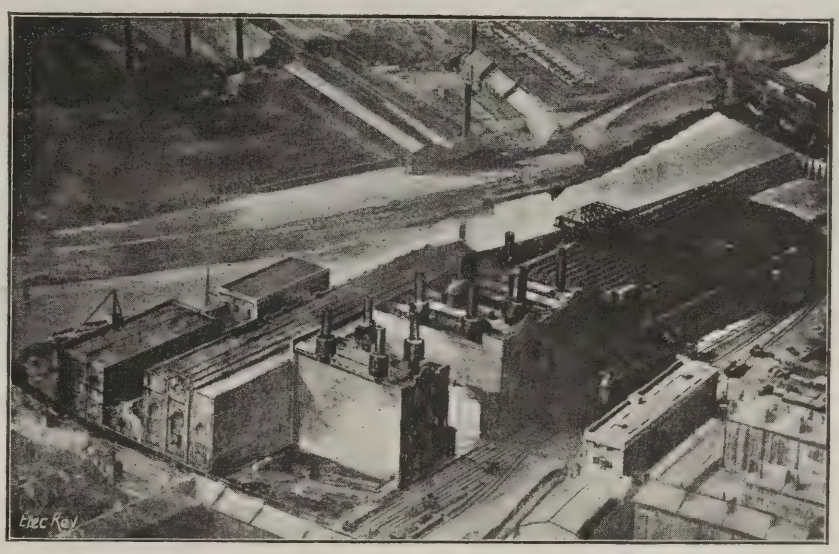

Fig. 2.—Aerial View of Dalmarnock Station.

Fig. 3.—One of the Boiler Rooms.

Glasgow, by process of continued expansion, acquired ready-made central stations at Kelvinside, Govan, and Partick; these have now been relegated to the position of sub-stations. At the end of the last financial year there were 32 important sub-stations in active operation and another three nearing completion; in addition, there were 101 completed sub-stations on consumers' premises. The sub-stations are

of the static type for d.c., and have rotary converters for d.c. distribution.

The total quantity of energy generated for the year at the time of the last (1925) annual report was 220,040,292 kWh, and of this amount 174,917,610 kWh was sold to private consumers. The remainder was expended on lighting 4,030 public lamps and in distribution. The gross revenue for the year amounted to £1,242,119.

The Glasgow Corporation was a pioneer in the encouragement of the all-electric house movement, and has successfully operated an assisted-wiring scheme for small houses. The wiring is done by contractors at agreed rates, and payment by the consumer is spread over a number of years. Over 2,000 separate premises have been fitted under this scheme to March this year. The displacement of gas by electric cookers is making rapid progress, and there is a special rate of ¾d. per unit for domestic cooking and heating, which is attained after 730 hours' use per annum of the maximum demand for lighting. The ordinary domestic lighting rate is at present 4½d. per kWh. An alternative "two-part" rate is available to domestic consumers. The parts are: (A) A fixed service charge per annum; and (B) a charge of ½d. per unit for all energy consumed.

The Electricity Department is extending its showrooms, and has a capable staff specially devoted to publicity and demonstration purposes. Recently an attractive lighting bureau, largely supported by the Corporation, was inaugurated in central Glasgow, and has proved most successful. At the new refuse destructor plant now being installed by the Corporation at Govan electro-magnetic separators will be used for fuel section, and the steam generated will be utilised in conjunction with frequency rectifiers.

Dalmarnock Generating Station.

The Dalmarnock station is on the north side of the River Clyde, with easy access to abundant water supplies; it was designed for an ultimate capacity of 200,000 kW. The switch-house buildings and annexe screen the greater part of the works when viewed from the south bank of the river, as is evident from fig. 1. In the centre of the switch-house buildings is the administrative block, with a battery room in the basement; the 250-volt battery contained therein is used chiefly for excitation. On the top floor the control room is placed, and from this ordered and quiet apartment the giant

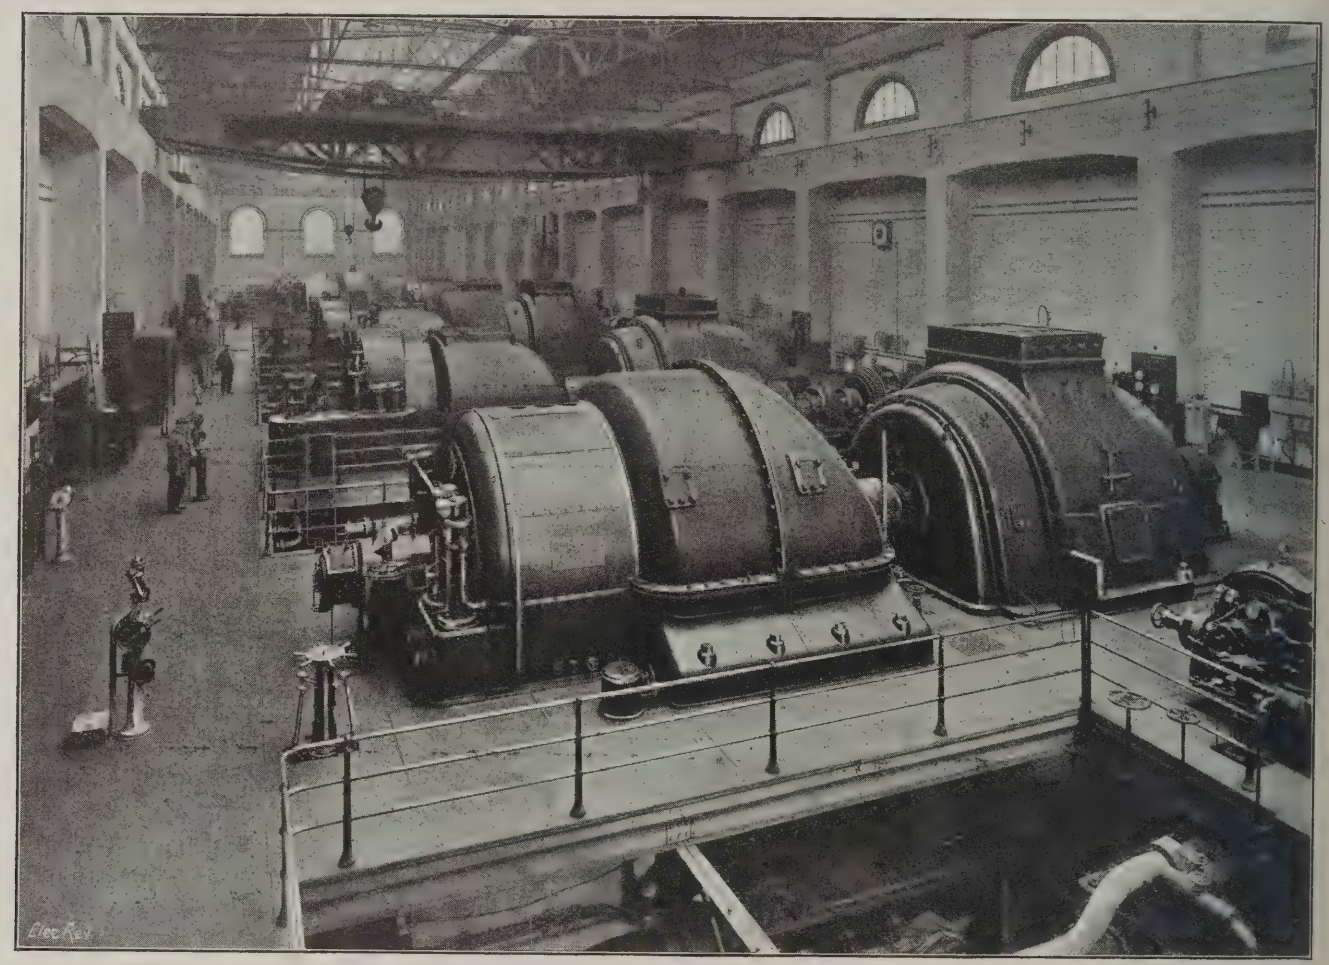

Fig. 4.—The Turbine Room, Dalmarnock Power Station, Glasgow.

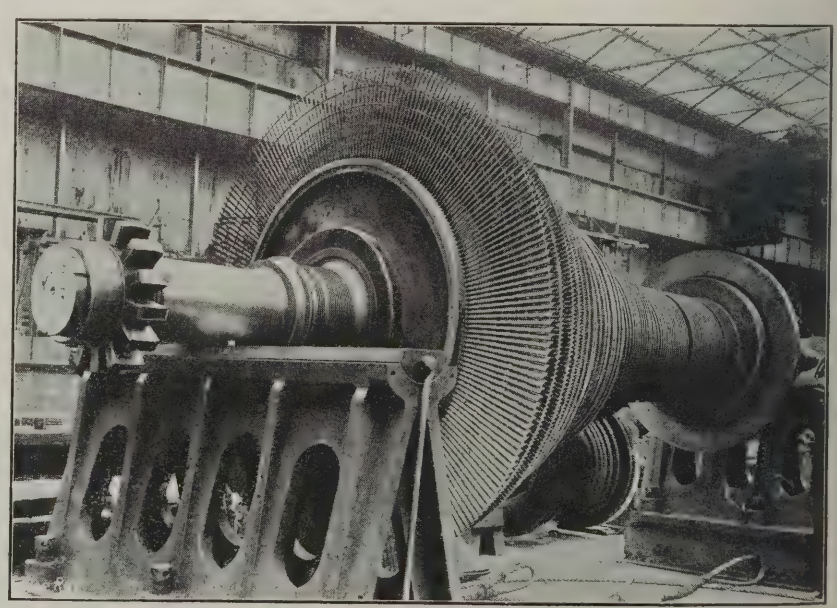

Fig. 5.—A Completely Bladed "Parsons" Turbine Rotor.

switches are operated and the whole electrical control of the station is carried out. A gangway opening from the control room leads to a balcony overlooking the turbine room.

Switch Houses.

The generator and outgoing feeder switchgear is of the metal-boxed, oil-immersed type, and is designed to attain a high degree of safety. The bus-bars are compound-surrounded and completely and continuously metal-clad. The step-up transformers, which raise the generated voltage of 6,500 V to 20,000 V, are housed below the 20,000-volt switchgear.

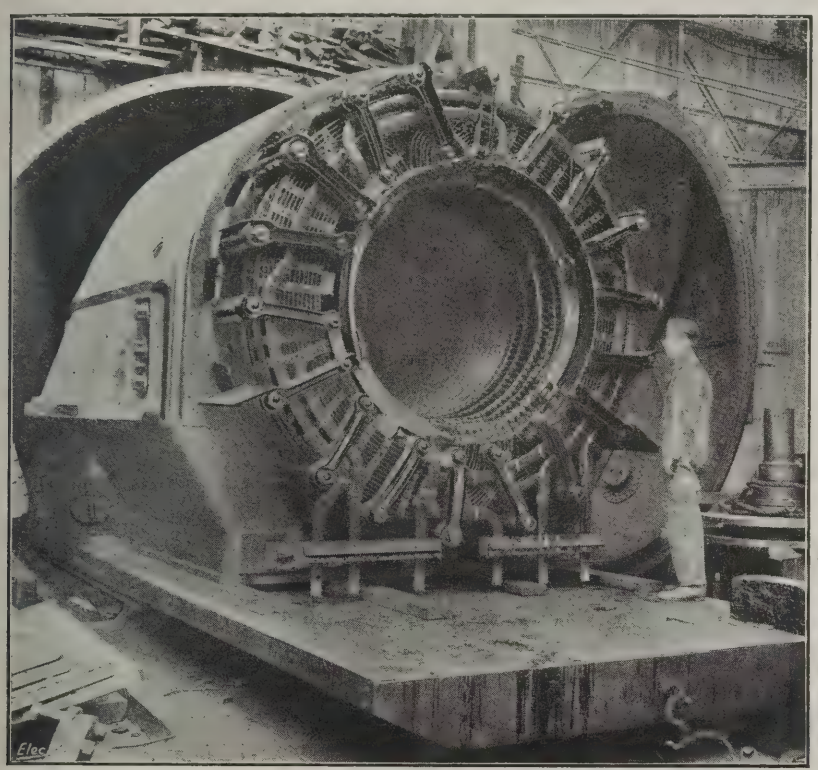

Fig. 6.—A "Parsons" Stator entering the Vacuum Oven.

Each of the large 6,500-volt alternators has its own bank of three single-phase transformers. The individual transformers are rated at 7,800 kVA, single-phase, 25 cycles, and the bank of three forms a 3-phase unit of 23,400 kVA. The n.p. and l.p. windings are sleeved with cambric, and the coils are insulated and spaced by shaped sheets of Fullerboard.

Each transformer is contained in a stout boiler-plate tank adapted for forced oil cooling. Water is circulated to the oil coolers, and relief valves are provided and adjusted so that the oil pressure is in excess of the water pressure. Should leakage occur, the balance ensures that the water cannot leak into the oil.

The transformers have a full-load efficiency of 98.89 per cent. and a half-load efficiency of 99.06 per cent.

Between the switch-house building, which contains these transformers, and the turbine house is a culvert 11 ft. wide, running the entire length of the building. This is being constantly filled from the Clyde, the water being first cleansed from *débris* by barred gratings, endless perforated metal bands, and ingenious rotating disk screens. The water from this culvert is pumped through the turbine condensers and passes to a similar discharge culvert on the other side of the turbine house. Each turbine set requires about one-and-a-quarter million gallons of water per hour.

The Boiler Houses.

The boiler houses, which have their axes at right angles to the turbine house, are clearly shown in fig. 2, which is an aeroplane view of the station. Each room contains eight boilers of the Babcock marine type, and they are arranged four on each side of a room, as shown in fig. 3, which also illustrates the chain-grate stokers. The feed water is heated to a temperature of 150 deg. F. by turbine steam before entering the boilers. The boilers are fitted with integral superheaters designed to increase the steam temperature to a total of 700 deg. F. Green economisers are employed, housed on the floor above the boilers, where also are the induced-draught "Sirocco" fans. Each boiler has a normal evaporation of 50,000 lb. per hour with a hot-well temperature of 150 deg. F., the calorific value of the fuel being taken at 10,500 B.th.u. per lb. The station standard steam conditions are 270 lb. per sq. in. gauge pressure at the turbine stop valves, 700 deg. F. total temperature, and there is an exhaust vacuum at full load of 29.1 inches (barometer at 30 inches).

Two of the boilers now being installed are fitted with Murray tubes, and their performance will be noted with interest in these days of striving for greater thermodynamic efficiency. Each pair of boilers is served by one steel chimney. Until now the ash has been dealt with by suction methods, but the latest boilers are provided with sluicing channels and pits.

The coal storage and handling arrangements are specially extensive and complete, and both electric and fireless steam locomotives are employed for shunting in this department.

The Turbine House.

Coming back to the turbine house, we note that generally the steam from a nest of four boilers passes through two 12-in. diameter pipes to a receiver in the basement, and this receiver is connected to a turbine by a 16-in. pipe. The receivers are themselves interconnected through two 12-in. pipes. The turbo-alternators are each continuously rated at 15,000 kW and generate at 6,500 volts. The condensers and their gear are placed in the basement, as indicated in the foreground of fig. 4, which is a general view of the turbine room.

No. 1 set, in the foreground, is by Messrs. Fraser and Chalmers, with a Metropolitan-Vickers alternator, and has a Mirrlees ejector condenser.

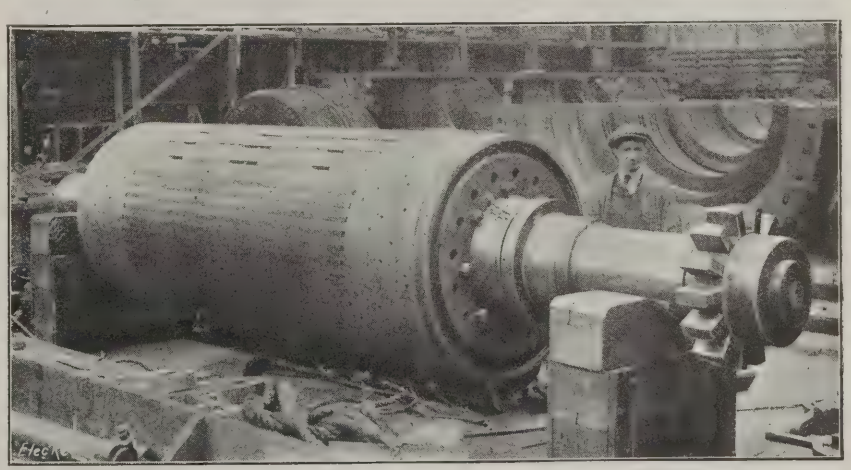

Fig. 7.—The Completely Wound Rotor.

Nos. 2 and 3 are Metropolitan-Vickers turbo-alternator sets with an M.-V. rotary air pump condenser on No. 2 and a Westinghouse-Le Blanc condenser on No. 3.

Nos. 4 and 5 are complete English Electric units, No. 4 having a Mirrlees condenser. This make of condenser has also been adopted for the most recent sets, installed by Messrs. C. A. Parsons & Co.

The Parsons Turbo-Alternators.

These two new sets, Nos. 6 and 7, have single-cylinder turbines of pure reaction design, while the five earlier turbines are all of the impulse type. Fig. 5 is a photograph of the turbine rotor with the mild-steel blades all fixed in position. For the first twelve expansions, axial clearance or "end-tightened blading" is adopted. (This efficient type of blading was described in the ELECTRICAL REVIEW of July 9th, 1920.)

Owing to the large diameters of the steam rotors at their last expansions, and the consequent difficulty of forging in one piece, the necessary diameters have been made up by the use of bolted annular disks so butted that vibration is impossible.

Following Messrs. C. A. Parsons's practice with similar machines, the centre of the shaft has been pierced along its axis to ensure that the forging is free from flaws.

The new alternators have, like the earlier units, direct-coupled exciters, and the voltage regulation is carried out entirely on the shunt field circuits of the exciters.

The stator is illustrated in fig. 6. The core conductors are of "Parsons" helically-stranded coreless cable manufactured in the required D shape.

The rotors are of barrel type, with the windings of copper strip having mica insulation. Fig 7 illustrates a completely wound rotor.

The alternators are provided with the Parsons closed-circuit ventilating system, using surface air coolers. This method is very efficient, and improves the external appearance of the sets, which have a clean and pleasing outline. These sets are designed for 18,750 kW (23,450 kVA), 6,600 volts, 2,050 amperes, at 0.8 p.f., 25 cycles, at the speed of 1,500 r.p.m. They are expected to give highly effective service.

Steel Works Modernisation.

The Electrical Equipment of the New Plate Mill, of the Consett Iron Co., Ltd.

ONE of the most important examples of steel works reconstruction completed in recent years is the plate mills of the Consett Iron Co., Ltd.

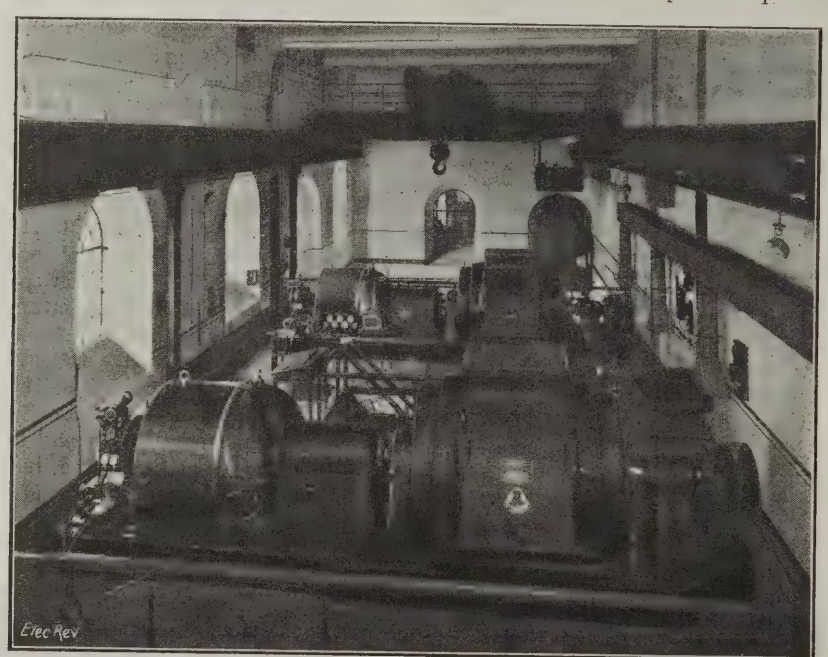

Fig. 1.—Part of the Steel Works Electricity Generating Station.

The site of the original mills having been entirely cleared, new buildings and plant have been installed throughout, the aggregate capacity of the main and auxiliary machinery supplied by the English Electric Co., Ltd., amounting to some 60,000 kW; since 1906 this Company has been responsible for the installation of over 300,000 h.p. of main rolling-mill drives.

The Consett Iron Co.'s new plant consists of: 40-in. two-high reversing slabbing mill with 8 ft. 6 in. rolls; 42-in. two-high reversing plate mill with 9 ft. 6 in. rolls; 32-in. three-high light-plate mill with 6 ft. 6 in. rolls; 30-in. chequer-plate mill with 6 ft. 6 in. rolls.

The slabbing mill is designed for dealing with ingots up to 10 tons in weight, and its product is passed in the form of slabs to both the large-plate and the light-plate mills, the former rolling down to approximately 9/16 in. thick, and the latter to 7/16 in. as averages; a proportion of the light-plate mill product passes on to the chequer mill. Electrical drives have been used throughout for the main and auxiliary machinery, the latter including live rolls, manipulators, screw-downs, shears, skids, cranes, &c. The Consett Iron Co. has equipped a generating station with two 3,000-kW, 3-phase, turbo-generators and a 1,000-kW, d.c., geared turbo-generator, in addition to three 1,500-kW rotary-converter sets for d.c. auxiliary power. As an additional source, a parallel supply is taken from the Newcastle-upon-Tyne Electric Supply Co., which can be either utilised as 3-phase power or converted by the above-mentioned rotary converters to direct current.

Each of the "English Electric" alternators (fig. 1) has an output of 3,000 kW, 3 phase, 40 cycles at 3,300 volts; the geared set consists of a 3,000-r.p.m. turbine driving a 1,000-kW, 550-V, d.c. generator at 600 r.p.m. The converter house (fig. 2) contains two 1,500-kW rotaries; the incoming voltage to the transformers is 3,000 V, and the d.c.

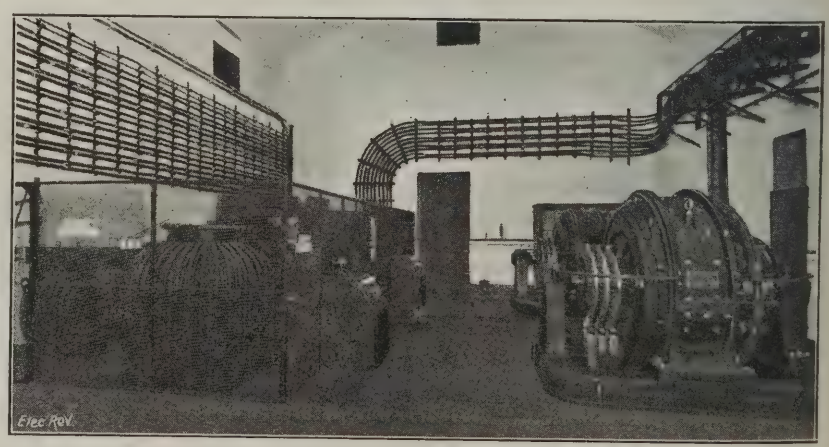

Fig. 2.—The Rotary Converter House.

output is at 480/525 V, the machines being level compound-wound within this voltage range. The third converter (of similar power) is housed in the same building

as the main flywheel-equaliser sets, and is shunt wound. This difference in windings was decided upon as the latter machine is much closer to the auxiliary machines which it supplies, and the falling characteristic of its shunt winding corresponds to the drop in voltage in the longer leads from the level compound-wound machines.

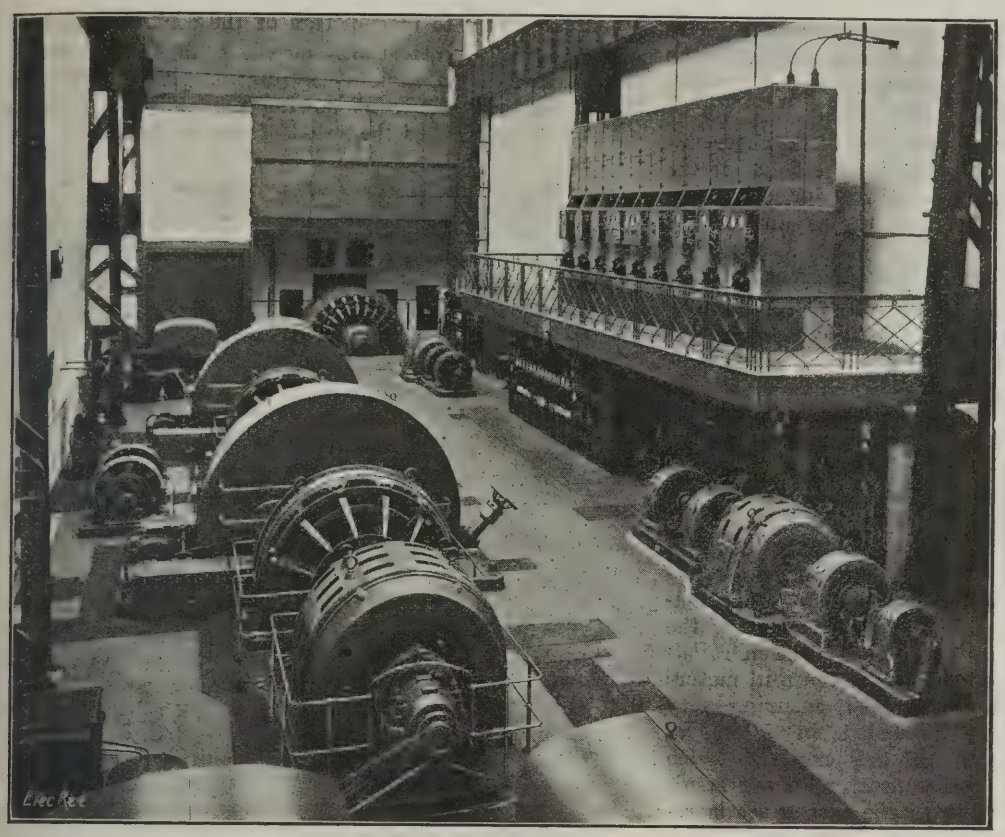

Fig 3.—Motor Room and Switchboards.

All three embody roller bearings and "tap" starting. The 40-in. slabbing mill and the 42-in. plate mill are both two-high and driven by reversing motors which take their power from two flywheel equaliser sets illustrated in fig. 3; the incoming 3,000-V switchgear is on the platform on the right, below which is a d.c. distribution board for pumps, fans, &c. On the left are the two flywheel sets mounted in line together by means of a flexible coupling. The two exciter sets appear partly under the switchboard gallery, whilst in the foreground is one of the automatic slip regulators which maintain the input to the motors of the flywheel sets approximately constant by varying the speed of the set. On the extreme left in the centre of the flywheel sets can be seen a small motor-generator barring set, the duty of which is described later.

The reversing motors are duplicate machines of the double-armature type (fig. 4) designed for a peak power of 14,000 h.p. at 50 r.p.m. and a speed range of 0/50 r.p.m. at constant torque and of from 50/100 r.p.m. at approximately constant horse-power. The massive construction of these machines is illustrated by their leading particulars:

Weight of each complete motor, 180 tons.
Weight of two armatures, 80 tons.
Diameter of shaft extension, 26 inches.
Overall length, 324 inches.
Overall width, 211 inches.

The two halves of each machine are exact duplicates, and the shaft is extended at the remote end so that should any accident happen to the shaft end at present being used for driving, the armatures can be interchanged. The bearings are ring lubricated, but in addition a motor-driven pump provides flood lubrication if desired; forced ventilation is employed, filtered air being blown by motor-driven fans through ducts in the foundations up into the centre portion of the machines, whence it is distributed through the amatures and frames and finally blown out over the commutators. No through shaft is employed; each armature is fitted with its own stub shaft, and the connection between the two is formed by a steel ring which registers on coned extensions of the spiders; keys take the drive between the two machines, so relieving the coupling bolts from any shear strain.

The d.c. for each reversing motor is provided from a flywheel equaliser set, consisting of a 3-phase induction motor of 3,000 h.p. driving two variable-voltage generators, between which is mounted a built-up cast-steel flywheel, 48 tons in weight and 11 ft. 3 in. in diameter. The flywheel sets are duplicates of one another and are arranged in line so that they can be coupled together for further equalisation of the load, the coupling between the two machines being of a "flexible" type, made by the Wellman Bibby Co., designed to transmit momentary peak loads up to approximately 14,000 h.p. Each set is approximately 40 ft. long, but the use of solid couplings and five bearings has not introduced bearing difficulties whatever. The flywheel bearing lubrication pumps work to about 150 lb. per sq. in., under which conditions the flywheels float on a film of oil, making it possible to start the set with less than half load on the motor; double lubrication is employed, pumps belted to the

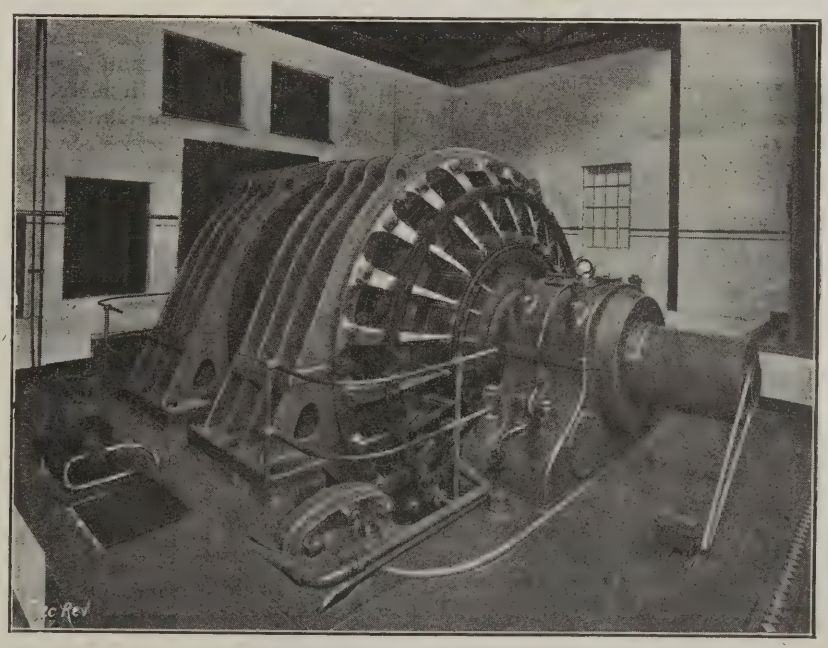

Fig 4.—Large-plate Mill Reversing Motor; 14,000 h.p.

flywheel shaft being in use when the set is running, while motor-driven pumps are used during the starting and shutting down periods and as a standby.

The motor driving each of the flywheel sets is of the 3-phase induction type, wound for an incoming pressure of 3,300 volts, 40 cycles, and drives the set at a synchronous speed of 600 r.p.m.; the working speed range is between 590 and 470 r.p.m. The generators in series supply the mill motors, and as they are subject to the peak demands have specially strong cast-steel frames, armature spiders, and commutator centres.

The control of the direction and speed of the reversing motors is brought about by adjusting the fields of the exciter machines which provide power for the fields respectively of the mill motors themselves and of the generators supplying them with power. The exciter sets consists of five machines (owing to the fact that the driving motor in the centre is synchronous, for which d.c. excitation is required) as follows:—Bucking exciter for mill-motor field; main exciter for mill-motor field, and for exciting the other exciter machines; synchronous driving motor for power-factor correction; exciter for fields of variable-voltage generators; and exciter for synchronous motor.

The employment of synchronous motors for driving the exciter sets was decided upon with a view to bringing approximately to unity the power factor of the complete plant, including the two flywheel sets, the light-plate mill motor, and chequer-mill motor. Each machine can provide 800 wattless kVA, a total for the two of 1,600 kVA. The use of quick excitation resistances for reducing the time constant of the mill motors and variable-voltage generators, thus ensuring very rapid acceleration, has been discarded in favour of special compound windings on the exciters which avoid loss of energy in resistances, with the result that the size of the motor driving the exciter set is reduced by about one-half, and in the present instance only approximately 110 h.p. is required for the purpose.

On the switchboard a panel is fitted with recording instruments to enable test readings to be taken of the operation of any equipment; throw-over switches allow the instruments to be inserted in either the slabbing mill motor or the plate mill equipments. The main controllers for the reversing motors, which regulate the exciter fields, are not on the control platforms in the

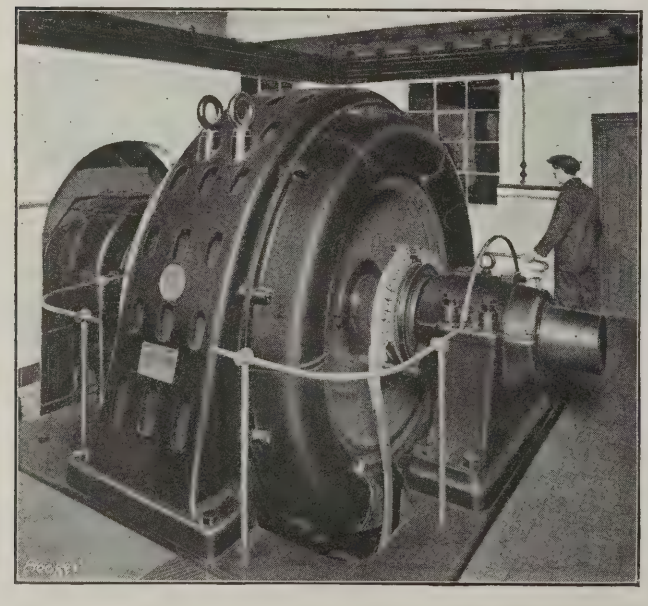

Fig. 5.—Light-plate Mill Induction Motor; 2,500 h.p.

mill where they would be subject to metallic dust and bad atmospheric conditions generally, but placed in the flywheel house reasonably adjacent to the exciter sets. The only connection between the control lever on the mill platform and the controller itself is a single play-pipe (filled with alcohol and water solution) ending in a diaphragm mounted in the pedestal of the control lever at the one end and in a similar diaphragm attached to a rocking valve lever at the controller end; movement of the control lever displaces the diaphragm from the central neutral position, synchronous movement taking place of the diaphragm at the controller, opening a valve which admits pressure oil to an operating servo-motor, which in turn sets the controller arm corresponding to the position of the control lever.

The mill driver stands adjacent to the instrument desk, so that the various instruments give him information as to the current flowing to, and the speed of, the mill motor and the speed of the flywheel set; a red

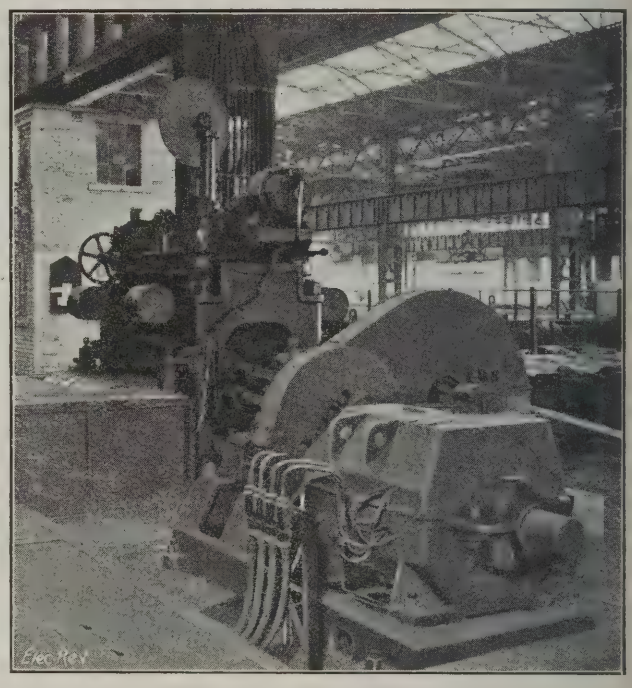

Fig. 6.—Plate Mangle Motor; 100 h.p.

lamp also warns him if the speed of the flywheel set has been reduced below the lower working limit, while "stop" and "start" push buttons enable him to close a relay circuit which opens or closes the field of the main exciter.

The various master controllers mounted in the background operate contactor gear which controls the screw-down motors, manipulator gears, and live rolls, while the automatic slip regulators have spring balancing devices for the moving blades in a soda solution in the tanks. The position of the blades in the tanks determines the resistance in the rotor circuit of the motor driving the flywheel set and consequently regulates its speed; the extent to which the blades are immersed is determined by a torque motor which drives the blade spindle through a chain, and the power of the torque motor is obtained from the input current to the flywheel motor. So long as the current to this motor remains at the desired value, any tendency to rotate on the part of the torque motor is counterbalanced by the weight of the blades. With increasing current the torque motor overcomes the counterbalancing force and raises the blades in the liquid, inserting resistance, which produces a fall in speed and thus liberates energy from the flywheel. With a reduced current the reverse action takes place, the weight of the blades causing them to enter further into the liquid, reducing the resistance, and thus speeding up the flywheel set again.

It was considered desirable to have means for obtaining slow movement of either of the main reversing motors or the flywheel sets. The provision of barring equipment on each machine would have been somewhat cumbersome, so the difficulty was overcome by the introduction of a heavy-current low-voltage motor-generator set; by this means current can be passed through the armature of either of the mill motors, or of any of the variable-voltage generators, of sufficient magnitude to produce half full-load torque with the fields of the machines normally excited, and a speed

which corresponds to a few revolutions per minute. The barring set is brought into use by plugging it on to the main bars which feed the particular machine to be rotated.

The heavy current, of the order of 12,000 amperes cut-out value, flowing between the generators of the flywheel sets and the mill motors necessitated the use of copper strip connections, and to accommodate them and the large number of field connections which pass between the various machines, the controllers, and the switch-board, an underground tunnel was constructed from one end of the motor house to the other; the two flywheel sets are placed approximately half-way between the two motors, and where the connections from the generators enter the tunnel the bars are arranged with a system of links whereby inter-changeability of any generator with any motor is possible. This will ensure continuity of production of either mill in the event of an accident to any one of the generators, the change-over of the main connections being accompanied by a corresponding change-over of the various field connections, and a switch-board, behind the d.c. switchboard, carries the necessary apparatus for this purpose.

Fig. 7.—General View of the Cooling Bank, showing Live-roller and Skid-gear Motors.

The light-plate mill is of the three-high "Lauth" type, in which the top and bottom rolls are power driven and the intermediate roll is brought into contact alternatively with the top and bottom rolls, and is rotated by friction by the roll with which it is in contact. A continuous-running 3-phase induction motor (fig. 5) of 2,500 h.p., running at 240 r.p.m., provides the necessary power, and interposed between it and the mill is a flywheel 38 tons in weight and 16 ft. in diameter; reduction gear, combined with pinions, reduces the motor speed to the 60 r.p.m. of the mill. The control pillar is of the standard "truck" type, and a liquid starter is employed; in conjunction with the latter there is a permanent metallic slip resistance designed for a drop in speed of 10 per cent. from no-load to full-load, so that the stored energy of the fly-wheel may be utilised for the heavy "passes."

The chequer-plate mill consists of a single two-high stand running continuously in one direction, one "pass" sufficing to "chequer" the plate, driven by a 3-phase motor designed to take peaks up to approximately 1,500 h.p.; it is of the simple induction type, runs at 240 r.p.m., and is geared down to the mill speed of 35 r.p.m. Overhung on each side of the pinion of the reduction gear is a flywheel 8 ft. 6 in. diameter, weighing $11\frac{1}{4}$ tons, and the energy of these two wheels is brought into play by the introduction of a metallic slip resistance in the rotor of the induction motor.

Direct-current motors for such duties as live rolls, screw-down gear, manipulators, mangles, cranes, &c., have been adopted for use throughout the whole plant, as well as for similar duties in the angle and bar mills, which have also been reorganised. The "mill type," Class MM, is specially designed for the very heavy duty entailed, and four of them are used in connection with the slabbing mill. The two which operate the manipulators are each of 100 h.p. at 550 r.p.m.; one, of 60 h.p., controls the tilting device, and one of the two screw-down motors of 60 h.p. is mounted up on the top of the mill housing. The motors are of compact and strong design, and so built that in the event of an accident to the driving-shaft end, the whole machine can be reversed, thus bringing into action the shaft extension at the other end. The insulation used is fireproof, and precaution has been taken to prevent the lodgment of dust where it may cause trouble.

Fig. 6 shows a motor of this class, of 100 h.p., driving one of the plate mangling machines, but it differs from those previously referred to in that, in order to prevent excessive speed when no plate is in the mangles, a shunt winding is fitted as well as a series winding.

A view of the cooling banks appears in fig. 7, and in the foreground are seen the live roller and skid gear motors, the former of 40 h.p. and the latter of 60 h.p.

Some idea of the extent to which power is used for auxiliary machinery is indicated by the fact that over 280 motors have been supplied in conjunction with this equipment.

Independent Power Plant.—In a booklet by Mr. W. C. Mountain entitled "A Word in Favour of the Independent Power Plant," he defends the small power installation against the present movement in favour of the large supply station. He takes up the cudgels for the self-contained plant in the first place on the ground of the saving in distribution costs. The distribution costs of electric supply plants are out of all proportion to generating costs, and the bearing of this on the isolated plant is obvious. The author claims that an up-to-date independent plant with a good load factor can generate energy as cheaply as, or even more cheaply than, the big supply station, and he suggests that insufficient attention is given to the question of efficiency in the case of the small station. In dealing with the competition of the larger undertakings, he says that they will often go to very great lengths rather than allow the installation or continuance of independent power plants in their districts, and asserts that rates are frequently quoted which must be below cost price. Compensation is hoped for in the complicated and indefinite systems of charging, which are all in favour of the power company. The author points to the unfairness of the maximum demand system of charging, as the consumer may be debited for a quarter or a year with a maximum demand which may occur only once for a short period due to exceptional circumstances. In dealing with power factor, the author refers to the clauses inserted in the consumers' agreements whereby the energy charges are increased if the factor falls below a given figure, usually 0.8, which may mean a very heavy additional charge. Reference is also made to the attractive offers by supply authorities to induce consumers to dispose of their private plant and take a public supply. These offers are usually covered by a 3- to 5-years' agreement, at the end of which period, the author points out, the charges can be increased. Transformer losses in the consumer's equipment are not favourable to the consumer. Another disadvantage to the consumer is that he has no stand-by plant to meet a failure in the public supply. In dealing with the reliability of the public and independent plants the author makes reference to the proposal to supply the whole country from a few mammoth stations, and points out that in such a case the whole supply for the country could be more easily shut down in the case of war or industrial dispute. Among the many advantages claimed for the independent plant is that of the facilities afforded for the use of the heat in the exhaust steam.

Artificial Daylight.

With Special Reference to a New Installation.

By W. J. JONES, B.Sc., A.M.I.E.E.

It is well known that the light emitted from the ordinary gasfilled lamp has a greater proportion of red radiation than daylight, say, from a north or even a cloudy sky, and it is essentially in order to facilitate colour matching and the grading of materials that electric lamp manufacturers have devised special incandescent lamps, which, with their selectively tinted daylight bulbs, emit light that is very similar to daylight, since the blue bulb effectively filters out the excess of red light.

Fig. 1.—Lighting from Four Diffusing Units.

Although these lamps have been used with varying degrees of success for colour matching and in purely industrial applications, as, for example, the grading of leather, the grading of flour, also in chemical laboratories for judging the colour of precipitates, &c., they have not yet come into general use. Some attempts have been made to use them in shop windows, but invariably the cold effect produced is repellent. Lack of success in the use of these lamps is generally associated with one of two things: The light source itself is insufficiently concealed, or poor intensity of illumination. When the light is insufficiently diffused intense patches of deep blue are visible, which produce a psychological effect of coldness. The other cause of failure in these installations is due to the fact that the designer has not allowed for the absorption of light by the daylight bulb, and the resultant intensity is insufficient when compared with the light obtained under daylight conditions.

Recently the Lighting Service Bureau of the Electric Lamp Manufacturers' Association had occasion to provide artificial lighting for one of its smaller demonstration rooms. It was decided to try and produce, so far as possible, daylight conditions in this particular room, and, at the same time, afford a ready comparison between the lighting obtained in daylight, the lighting obtained from daylight lamps, and the lighting obtained from the ordinary gasfilled lamp.

Fig. 4 shows a section of the room under consideration, from which it will be noted that the daylight is obtained through a skylight. During the morning of a reasonably bright day in the winter 12-15 foot-candles of illumination are obtained on the table. A blind is arranged immediately under the skylight in order to exclude daylight. A diffusing glass screen is fitted flush with the ceiling, and above this, but below the blind, are installed 16 100-W daylight gasfilled lamps in mirror-lined troughs. There is no reason to suppose that alternative equipment, such as shop-window reflectors, &c., would not prove equally serviceable.

In the room itself four diffusing fittings are installed, each provided with one 100-W clear gasfilled lamp. Table I (overleaf) gives some information concerning the relative intensities of illumination obtained on the table.

Photographs were taken of the room under both systems of artificial lighting and natural daylight, and these are reproduced in figs. 1, 2 and 3. It will be noticed in the case of the "artificial daylight" that there is a complete absence of glare, and a maximum illumination is provided on lower surfaces, while the brightness of the walls diminishes as the ceiling is approached. This is typical of daylight, for invariably the maximum illumination is obtained on the floor, or in any case in lower parts of the room. The second photograph shows how this distribution of illumination in the room is completely reversed, and is particularly noticeable when the light and shade effects are considered. The lighting from ordinary lamps seems quite yellow when compared with that from daylight lamps, while that from the daylight lamps compares very favourably with daylight itself.

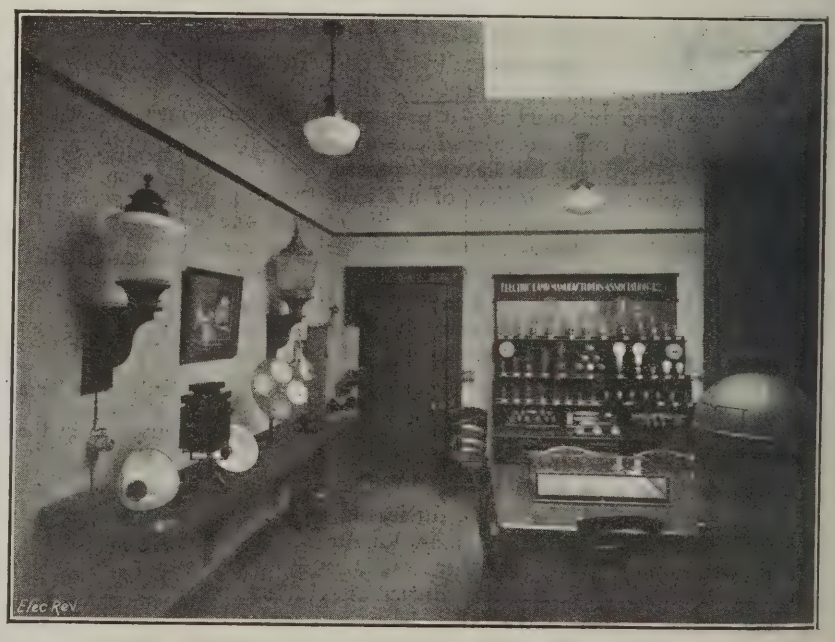

Fig. 2.—Lighting from Daylight Lamps above Skylight.

TABLE I.

TYPE OF LIGHTING.	INTENSITY.	WATTS.
Natural daylight	12-15 f.c.	—
Daylight lamps	15 f.c.	1600
Ordinary lamps in diffusing fittings	10 f.c.	400

So natural are the conditions produced by "artificial daylight" that an eminent assembly of engineers was entirely beguiled into the belief that they were holding their meeting under actual daylight, and were pleasantly surprised when, at the conclusion of their proceedings, they were informed of the true conditions.

Fig. 3.—Natural Daylight from Skylight.

It appears, therefore, that there is a considerable field for the use of illumination of this character, particularly if some satisfactory arrangements could be arrived at with electricity supply authorities regarding the cost of energy. For instance, such an installation in basement offices would be more valuable to the supply company from the point of view of revenue and constancy of load than an electric cooker, and the writer cannot see any reason why in such cases equally favourable terms should not be allowed. If this were possible the cost of lighting this room to the intensity and quality of daylight would only be 1.6d. per hour if the cost of energy were Id. per unit, and the expenditure of these small sums should make it possible to improve the monetary and utility value of parts of buildings which at the present time command a comparatively low rental due to insufficient daylight.

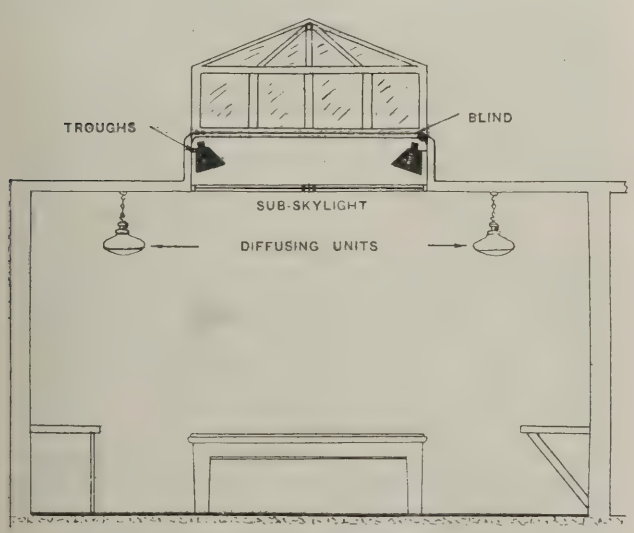

Fig. 4.—Section of Experimental Room.

"Cheapness" and Domestic Electrical Appliances.

By H. E. STRANACK.

THE columns of the technical papers and particularly the correspondence columns have recently contained statements in regard to an alleged public demand for "cheapness" in electrical fittings and appliances. Not only in those quarters, but amongst electrical dealers and contractors, particularly of the smaller or less pretentious type, there appears to be great timidity in approaching their customers with anything to which the adjective "cheap" cannot be applied. On being handed leaflets or literature concerning kettles, irons, toasters, simple electric light fixtures, bowl fittings or the like, at a manufacturer's establishment, the reply of such men is only too frequently: "Yes, this seems all right, but I'm afraid my customers will expect something a lot cheaper than any of these."

Again, where it is a question of the adoption of electric cooking, the question is so frequently put: "Will it be cheaper than gas?" or "How does it compare with gas?"—questions obviously unanswerable without a time limit in which the superiority or inferiority of the newer supplanting agent would have time to manifest itself. Of course, the fact that the retail purchaser asks such questions does not necessarily mean that he is going to refuse the adoption of electrical appliances if they are frankly stated *not* to be cheaper than the gas or other appliances which they are to supplant.

None the less, it may be well for dealers, contractors, and even manufacturers to ask themselves seriously whether or not they have not perhaps in their spoken arguments, used when effecting a sale or in advertisements, circular letters, &c., encouraged the public to ask for cheapness in electrical appliances much more than is justifiable when all the circumstances are taken fully into consideration, and whether they should not in the future leave this consideration out of their arguments altogether and carry conviction by stressing the excellencies or artistic, aesthetic, hygienic, labour saving and other predominant characteristics of things electrical.

It may not be amiss, in this connection, to reflect on what history has to teach us, after which I feel sure that we can safely make the assertion that progress has *not* been along the line of cheapness, but invariably *along the line of superiority*. That is why in our day (we can be optimistic) electricity is making headway in all departments of life; it may, of course, be cheaper in some, even in many directions—but that is not the reason for the advance and for its supplanting all other agents—that advance, and that supplanting are due to the excellent qualities mentioned above.

In support of this opinion, what then can we learn from the more or less recent past? Gas as an illuminant universally replaced candles and oil lamps—it was incomparably dearer, besides which, it had to be expensively installed and lacked the qualities of portability and of being self-contained possessed by its predecessors.

The writer is old enough to remember the introduction of typewriters into city offices; at first they were all one price, *viz.*, £25 each, and no one thought of claiming that they were cheaper than pens, ink and blotting paper. No! but they were a progressive step—therefore, they came and conquered.

Again, a very ordinary motor-car will cost at least twice as much in initial outlay as did, say, 30 years

ago, a pony and trap, and yet instead of there being fewer motors on the roads than there are horse-drawn traps, dog carts, &c., there are probably several hundreds to one.

One of the most successfully sold electrical appliances—the electric suction cleaner, supports this argument most strongly as its extensive sales have been reached not by offering it as being as cheap a contrivance as brooms and brushes, but by the frank admission that, whereas, those old-fashioned and inefficient implements only cost a few shillings, their electrical successor runs from thirteen to twenty-five guineas—in other words, it sells because of its superiority.

Instances could be quoted indefinitely, *e.g.*, the cost of the "push bike," beloved by the clerk or tradesman of the 'nineties, and the "motor bike" costing twelve times as much which his son somehow manages to be able to purchase

Most curious, perhaps, is this demand for cheapness when made by lady customers—I have often been told by a lady when showing her particulars and prices of domestic electric appliances that although they are no doubt good, yet they are so "frightfully" expensive as to be out of all question. To meet this, the electrical salesman must, of course, be able to draw attention to the "excellencies" of his goods, and by dint of persuasiveness and sound reasoning bring the lady to envisage the matter from the true point of view—which, in most cases, he will probably succeed in doing if sufficiently tactful. Artistic merit, utility, hygiene, all these qualities can be evaluated.

When selling an electric fire, it is quite permissible to point out that the family is going to sit round it in a semi-circle, that their eyes are going to rest upon it and, therefore, the less its design is akin to a sort of cross between a superannuated tombstone and an old-fashioned coal scuttle the better!

As a matter of fact, when asking for cheapness at the expense of aesthetic qualities, the modern woman forgets that she herself is a living contradiction of the principle involved. The red fox fur round her neck cost far more than the wrap which was employed to keep her grandmother's neck warm, and the same is equally true of her silken hose (several times the cost of the black stockings which they have replaced), and the dainty footwear as compared with the boots of preceding generations, all costing far more, yet successfully ousting the previous types.

The unnecessary acquiescence in this "cheapness" demand (instead of tactfully and skilfully explaining it away) leads, when we come to contracting work, to strange incongruities. The writer has seen a dining-room table costing, say, ten pounds, illuminated by a gimcrack and tawdry fitting costing, say, fifteen shillings, and he recently visited a clergyman's study which was lighted by a clear glass bulb lamp "shaded" by a very shallow 10-in. opal, the sides of which allowed the bulb to project with all its "glare" effect. What induced the technical electrician to install such a thing in such surroundings—nicely bound books, well upholstered chairs, and suitably framed pictures?

In conclusion, therefore, let us banish this "cheapness" fetish from our calculations, be prepared with the correct arguments to knock its backbone out whenever we meet it, and all of us "do our bit" to elevate electricity in the home to that dignified correspondence with environment that it enjoys in public buildings, large stores, banks, theatres, kinemas, &c., where this unreasonable craze has not been pandered to.

The Need for Accurate Costing—Why Wait?

A Suggestion for Speeding up the Incipient Trade Improvement.

(COMMUNICATED.)

THE recent decision of the Army Council to abolish the greater part of the short-lived system of departmental accounting, advocated by the Lawrence Committee, has brought down upon their heads a torrent of adverse criticism. Their action, showing their apparent distrust of this newly-instituted, but by no means untried, method of departmental financial control, has been incomprehensible to those who have had the opportunity to see and prove for themselves the advantages, and perhaps uncomfortably great possibilities of effecting economies, that may be provided by this system.

Members of the Lawrence Committee, prominent accountants, politicians, and many business men have all given vent to their feelings of disapproval, either at meetings or in letters to the Press, or otherwise. The Army Council have, apparently, but few supporters willing to stand up for them. However this may be, there is one aspect of the situation that appears so far to have escaped notice. Righteous though the critics may be in their attacks on the Army Council, much of its force might, with equal justice, have been directed against many of those who have the control of manufacturing industries in this country under their charge. Whether they be right or wrong, the attitude of the Army Council is far from unique, and not really very different from that of many of these manufacturers themselves, though the latter have not been slow to join in the chorus of criticism against the former.

As is well known, every business worthy of the name has its own set of cash books, purchase ledgers, sales ledgers, journals, and so on, in which are kept with scrupulous care, and by double entry, an exact and careful record of all receipts and payments of cash, cheques and bills of exchange; the utmost care is taken to see that no mistakes can creep unnoticed into these accounts, that no payments of the firm's money, or receipts on behalf of the firm can possibly occur without a corresponding entry in the appropriate account, and that the books always balance exactly. If it should happen that a balance cannot be struck at the first trial, then the mistake has to be found, no matter how small the amount may be.

The following instance, telling what recently took place in a large manufacturing firm, with two millions of capital, will suffice to illustrate the point. At the end of their financial year, when the books were balanced, they were found to be wrong by ten shillings. An immediate search failed to show where the error had occurred, and the accounts staff had to work overtime in order to find it. For four whole days, including three hours' overtime every evening, the search for the ten shillings that were lost continued, to the detriment of much of the ordinary routine work of the office. Every account was added up, and re-added up, checked and re-checked, until at last, on the fifth day, a shriek from a small girl working a comptometer adding machine heralded the announcement that a ten shilling mistake in the addition had been found. There is, of course, on this type of machine no typewritten record of its work, and consequently no means of comparing the figures fed to the machine with those in the ledger; probably because these machines were still an innovation in this particular firm, the glamour of their ingenuity had not yet worn off, and the possibility of an error in work done by them had never even been suspected, until in desperation a check of their results was ordered.

This, it is to be feared, is no exaggerated description of what takes place in many a counting house at the end of their financial year. It is cited here merely as an instance of the enormous importance that is attached to making the financial books balance absolutely, to the nearest halfpenny. The modern system of accountancy has been perfected to such a pitch that errors, even of negligible and insignificant amounts, have no place in the books of even the largest firm. There simply could not happen such a thing as a company presenting its balance sheet to the shareholders with a note of regret to the effect that the accounts were unfortunately found to be wrong by a penny, and that a prolonged search had failed to discover the missing coin! Yet one hesitates to think how many pounds it must have cost this concern in salaries, stationery, heating, lighting, not to speak of tempers, to find the penny that was lost. Regardless of time and expense, the financial accounts of all businesses are made to balance—in the end. Manufacturers, and other business men, all over the country, are in this respect unanimous with the Army Council. They are great believers in the powers of sound bookkeeping. All of them attach the utmost importance to proper and correct accounts, and, of course, no one but a fanatic would have it otherwise. Accounts, if they are to be of any use at all, must be correct, absolutely correct, and not even a penny out!

However this may be, the value of even correct accounts has, after all, its limitations. No matter how excellently or how accurately a firm may keep its accounts, this alone can be no criterion of successful business, or even of economical working inside the business. The fact that accounts can be shown to be a "true and correct view" of the financial position, does not also show that the money of the business has been well and wisely spent. A firm may have a model counting house staff, and the best auditors in the world, and yet be in a financially unsound position, merely because the business has been conducted uneconomically; for books of account, pure and simple, can safeguard only coin and credit.

Obvious though it may appear to all, the full significance of this limitation of accountancy seems to be but rarely understood. Because financial accounts do, in a most thorough manner, control the expenditure of the cash of a business by preventing any payments taking place without the personal knowledge or signature of a responsible director, this is often thought to be all the control of expenditure that can be necessary in a business. Such, apparenly, is the view of the Army Council, which takes ample steps to satisfy itself that its budgeted expenditure is not exceeded in any direction, unless, of course, its special permission has been previously obtained. Such also appears to be the opinion of many directors of manufacturing concerns, who have provided themselves with a sufficient staff to keep the financial accounts of their business, but require no other check over expenditure.

It is proposed to show why it is that in the Army, as in business, financial accounts are themselves insufficient as a means of controlling expenditure in an economical manner, and wherein lies the remedy.

In every business, an enormous amount of time and care is invariably expended on the buying of raw materials, so as to obtain good quality and suitable material at a low competitive price; to obtain the best possible discounts, terms of credit and terms of delivery; and at the same time to guard against secret commissions at the expense of the business, and mistakes being made in the amount of money paid for materials. Thus far, but no farther, does the financial control provided by books of account proceed. Once delivered to the works, the material is handed over to the shops where it is used as required. It may be wasted, or it may not; it may be pilfered or it may not; it may be left lying about inside stores, or in the shops themselves, or even outside in the yard; it may lie there to deteriorate or rust away, and eventually be forgotten, or it may be used to good purpose. Whatever be its ultimate fate, there is seldom any evidence that it is someone's especial charge to find out how it is used. It certainly is not treated as if it were as valuable as money, for once in the shops, the control of the expenditure of material, though it may nominally rest in the hands of the foremen, or a storekeeper, is often either lax, or altogether non-existent. Even when some record of its use is kept, no great importance is attached to its accuracy, and still less to its balancing exactly like an account. If, at stocktaking, a few dozen pieces, or a hundredweight or two are missing, oh, well! it must have gone somewhere! the difference is simply written off, and no further thought or attention is given to the matter. Yet, when one comes to think of it, what difference is there between this material, and the money that is so jealously paid for it, but form and appearance? Why is such scrupulous care taken of payments of money to the suppliers for material, and so little of the material received in exchange? Why should the expenditure of money be so amply safeguarded, when the material, its equivalent in value, is treated with disregard? Why indeed? How, at all events, do these firms, at the end of the year, contrive to compute, to the nearest halfpenny, the value of their stocks on hand, in order to complete their balance sheets?

Much the same may be said about money paid for labour, in the form of wages. It would be interesting and illuminating to have some reliable statistician calculate the cost of wage agreement conferences during the past decade, for the sum must, indeed, be formidable. Wages are the life and soul of industry. If wages are too high, industry cannot stand the strain, and must eventually fail. If, on the other hand, wages are too low, the workmen cannot live and support their families. They do not give of their best work, and industry suffers again.

Many employers to-day will have it that wages are too high, and that improved trade can only come as a result of lower wages. They regard demands for increased wages or salaries as fantastical and out of the question at the present time; they even spend much of their own time in personally examining pay rolls with the intention of cutting them down, either by reducing the staff, or else reducing the rate of wages.

But in men who have been given their appointments, or engaged, personal interest, in so far as their work is concerned, is not always as keen. It is left almost entirely in the hands of foremen and heads of departments to supervise the work of the workmen and staff, and to see that the best use is made of the time for which they are paid. Little or no concern is caused by a queue at the stores window, or by extended perambulations on the part of men understood to be looking for tools, or going to fetch a drawing! Waiting for the crane, waiting for materials, or continual changing over from one job to another, and consequent waste of time in setting up and re-setting up machines, are all regarded as an inevitable part of the process of manufacture. A few exceptions there certainly are who see therein waste of money, a part of which, at all events, there is a chance of turning to better advantage.

How is it that the same praiseworthy care with which pay packets are made up, and handed out on Friday night, that is when the money is being spent, is seldom so much in evidence during the rest of the week, when its equivalent in time is being spent? What happens if a man finds at the end of the day that he has recorded on his time sheet how he has spent 8¼ hours instead of 8½ hours? Does he put in overtime until he has remembered how he spent the odd quarter of an hour, or does he just lump it in on to the job that will stand it best? So far as is officially known in most firms, such dilemmas simply do not arise! In a few others, they are prevented from arising.

Quite recently, the writer happened to come across an interesting example of this sort of thing in a firm where none of the directors was aware of the method by which overtime pay was calculated. It transpired that it had been the custom of the concern to pay overtime, at the rate of time and a third, for each quarter of an hour worked, so that if a man worked ¾ hour overtime, he received the equivalent of one hour's wage. If only part of a quarter was worked, then the nearest number of quarters of an hour was taken as the basis, thus: A man who worked 32 minutes was paid as for ½ hour, but a

man working 38 minutes was paid as for ¾ hour, and so on. If, however, 35 minutes was worked one night, and three minutes the next, ¾ hour overtime was paid at the end of the week, just the same as if the 38 minutes had all been worked on one night. The natural and inevitable outcome of this custom was that all those men who were actually required to work, say, 35 minutes, or 50 minutes, or some period just over the quarters of an hour, invariably took several minutes some other night in the week to find and don their coats, thereby getting paid for an extra quarter of an hour at time and a third!

Though all the directors of this company knew that overtime was paid at the rate of time and a third, no one of them understood how the time itself was worked out, until it was revealed by certain investigations carried out for the company by the writer. Though ample control over money was always kept in their concern, similar careful control over the time was neglected. This money-while-you-wait facility is no longer provided by the company.

Similar occurrences with regard to many of the other numerous expenses of a business such as rent, rates and insurance, can also be cited. Much time, thought and argument is invariably devoted to the amount of money that has to be paid for each, but little or none to the best and most economical use of the space obtained and insured with this money. It is the same with every expense of a business; the coin or cheque or bill given in exchange for labour, material or service, is checked and counted and safeguarded so as to admit of absolutely no leakage, but not so the labour, material, and services themselves.

Despite all that has been said, it does seem that somehow or other, it is reasonable to expect that the control of money spent should also render possible the control of the usages of what is bought for that money. Ample control of the one should somehow lead to the ample control of the other, since they are the equivalent o one another in value. Nevertheless, whatever may b expected in this direction, no one would presumably be willing to accept a low figure for rent as an indication of a well laid-out factory, or a small pay roll as a sur sign of hard-working and well-organised workmen. One is quite compatible with the other, certainly, but not a consequence of the other. The pay roll may be small because the men work well, and are equipped with time-saving devices and tools, so that a large output is obtained from a small staff, or, on the other hand, the number of men may be small because the business an its output are both small.

What is it then, that prevents this dual control? Clearly there is something important missing which must be provided before it is possible to decide the truth or otherwise of such propositions as these. A low rent may under certain circumstances be a perfectly sound indication of the economical use of floor space. It will, for example, indicate a well laid out factory IF the rent per unit of production is also low compared with other similar factories. Similarly, a low pay roll is a true sign of hard working, efficient, and well-equipped workmen IF the wages per unit of output are also low compared with similar businesses, but only IF these second conditions also hold good.

This explanation will, it is hoped, make clear what it is also necessary to do in order that control of money spent may give control over what is obtained for it, namely, to provide the "means of measuring" the pay roll, or the rent of the factory, against some common standard such as the output. Accurate accounts alone can never provide this control, unless accompanied by some such "means of measuring." Then it can be decided without fear of doubt, whether or not the rent is too high, or wages are too high, for their size matters not at all so long as the rent or wage per unit of production is reasonably low. To put it in another way, the control of the expenditure of cash in a business only provides ample and sufficient control over what is received in return for that cash, if some means can be provided of measuring the use made, or benefit obtained from what is received in exchange for that money.

It is just this means of measuring or comparing that is so often absent in a business. It was certainly absent in the company whose directors were unaware of the basis on which the overtime wages were calculated. It is certainly absent again now in the Army, and presumably nothing will now be heard of the officers and privileged civilians who get their private hunters shoed at farriery training schools with Government shoes, Government nails, and in Government time, in return for a moderate tip; or about payments made in return for work done by regimental tailors who use Government material and Government thread, and are paid by the Government for their time; or about the regimental shoemakers. . . The means of measuring has now been removed, and though the allowances laid down in the regulations and in Army Council Instructions will not be exceeded, they will doubtless continue to be paid in full regardless of whether services are obtained for them in full, or not. No one will any longer be able to measure payments made against work done.

(*To be concluded.*)

Water-Power in the Argentine.

Potential Value of the Mendoza District Rivers.

(From our Special Correspondent.)

In no State of South America does there exist a more insistent demand for power generated on a commercial scale than in Argentina; it is needed for industrial plant (especially for the tramways) and the lighting of several rapidly-expanding cities. None of them can claim the usual advantage of occupying a location of natural water-power. All the large foreign-owned utilities companies employ electricity, and make use of imported coal as the source of energy. The utilisation of hydraulic power is therefore a matter of such supreme importance to Argentina that the Government has in its employment investigators and surveyors continually engaged upon search for suitable rivers which might be put to some commercial value.

Among the largest of the enterprises now being undertaken is the Hispano-Argentina super-power station; this will ultimately have a capacity of 500,000 kW, consuming daily 4,000 tons of coal, which it is proposed to use in a pulverised state.

A district hitherto little regarded as of potential value, but which now promises to become of some considerable worth from a hydraulic power point of view, is the mountainous part of Mendoza, which contains some of the highest summits of the Andes. Here, also, are several rivers which, as recent investigation shows, could be effectively harnessed to provide a large volume of power. Unfortunately, the amount of capital that would be required cannot be provided by the State alone, so that any enterprise would have to be undertaken by private or combined interests—private and State.

Towards this end, the Government has expressed its willingness to co-operate; or, alternatively, it is prepared to grant a concession upon certain terms.

A scheme which has recently been made the subject of special study relates to the harnessing of the waters of the Rio Atuel. The river runs strongly from the south to the north-west of the Mendoza province, following an unbroken course over several hundreds of miles of

rocky and at present profitless territory. As the river approaches the town of Nihuil, however, at a distance from the city of Mendoza of about 300 miles, the rocky formation abruptly changes, the waters of the river narrowing between the precipitous walls of a deep cañon. There then comes a sudden drop, forming a waterfall 310 feet in height, and extending over a distance of, roughly, some 550 feet. The flow, which in flood time is estimated at 550 cubic yards a second, has an average all-the-year-round discharge of 450 cubic yards per second.

The location is considered highly favourable for the erection of a large generating plant, estimated to produce between 40,000 and 100,000 h.p. of electrical power. By damming the river, thus providing an even flow throughout the full year, sufficient irrigation waters could be obtained to serve more than 600,000 acres of land—at present little better than desert—in the southern portion of the Province. Electric power for lighting and industrial purposes could be both easily and cheaply sent to the fast-growing city of Mendoza and supply, additionally, the flourishing residential suburbs which are extending around it.

Nearly four years ago, following an investigation made by the State Engineer into the possibilities of the Mendoza waterfall, the Minister of Public Works of the Province of Mendoza offered to grant a concession for the installation and operation of hydraulic plant at Nihual, upon the following, among other, conditions: the concessionaires were to commence and bring to completion a scheme of whatever kind the Mendoza legislature—after taking technical advice—might determine upon. The sole compensation offered to the concessionaires was the right to operate commercially the plant for their own account over a limited number of years, not specified in the first announcement. At the end of the period determined upon, the plant and installation would be delivered in good working order to the perpetual ownership of the provincial government of Mendoza. Before operation of the plant could be commenced, a tariff of charges for the supply of light and power would have to be drawn up and submitted to the Legislature for approval; application for continuance would have to be renewed every five years. A certain percentage of the financial receipts would also have to be paid to the province. A deposit of $100,000 (paper) would be made as a guarantee for faithful compliance with the terms of the contract, upon which work must commence six months after signatures had been attached. Upon its part, the Provincial Government would exempt the concessionaires from taxes and imposts of all descriptions during the life of the concession, and would also undertake to expend a maximum sum of $10,000 for the purpose of making the preliminary studies and topographical surveys.

In view of the extremely one-sided terms of the proffered concession, it is not difficult to understand the small interest aroused.

The Mendoza power scheme, however, is but one among many hydraulic enterprises that are possible in Argentina, inclusive of the Iguazú Falls enterprise, to which reference has already been made in the columns of this journal. Since that article appeared, a United States firm of hydraulic engineers, it has been reported, has expressed itself ready to carry out a scheme with the view of conveying 300,000 h.p. from the falls of Iguazú to Buenos Aires, at a cost not exceeding 60 per cent. of the present cost of electricity.

Electricity Recommendations at Southend.—In a report to the Southend Town Council on its electricity undertaking, Mr. J. H. Rider recommends, *inter alia*, the erection of a new steam power station at South Fambridge to supply Southend as well as a large area to the north of the borough, and that as soon as this station is ready the Diesel engines at the Leigh and Thorpe power stations should be abandoned entirely. He further recommends that a fourth Diesel engine should be installed forthwith at the London Road power station to maintain the supplies until the new station is at work, and that the Diesel plant at London Road should be kept in service for a number of years to work in conjunction with the new power station during peak load periods.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Abu Zabal Wireless Station.—On June 10th, Lord WOLMER informed Mr. Ammon that negotiations for the sale of the Abu Zabal wireless station had reached an advanced stage, but the transaction had not yet been completed. He was not, therefore, at liberty to disclose the proposed purchase price or the conditions on which the sale would be effected.

The Finance Bill.—On June 8th, during the Committee stage of the Finance Bill, Mr. FENLY moved that the "safeguarding" duty on imported arc lamp carbons should be 3d. instead of 1s. per lb., as proposed in the Bill. The amendment was defeated by 245 votes to 135.

Mr. PETHICK-LAWRENCE moved to omit from the "safeguarding" duties amorphous carbon electrodes (not including primary battery carbons or arc lamp carbons). This was defeated by 240 votes to 128.

Mr. LIVINGSTONE moved to omit "vulcanising paper" from the scope of the new "safeguarding" duties on paper. He said that vulcanising paper was a raw material which was very essential and important for the electrical industry.

Sir B. CHADWICK, Parliamentary Secretary to the Board of Trade, said that vulcanised paper was produced in this country, and that was why a duty was put on the imported article.

The amendment was negatived by 225 votes to 127.

Slack for Electricity Undertakings.—On June 7th, Mr. LANSBURY asked the Secretary for Mines whether he was aware that certain coalowners and others were offering for sale large quantities of slack and waste deposits lying in and around the pits to electricity undertakings, such undertakings being the only industries which under great difficulties were able to utilise that waste; that those deposits were, in the ordinary course, considered of no value and were written off as a loss; and would he consider the advisability of using his powers under the emergency powers regulations to take over the heaps of slack piled up in mining areas, and so prevent exploitation in this respect.

Colonel LANE-FOX said that one or two complaints about the prices charged for slack had reached him, and he was looking into them. He was quite prepared to consider exercising powers under the Emergency Act to requisition coal or control prices if, in the last resort, this should prove necessary for the protection of the consumer.

Communication with Australia.—On June 8th, Sir A. SINCLAIR asked the Postmaster-General whether, in view of the statements by the managing director of Amalgamated Wireless (Australasia), Ltd., that Australia had stations capable of conducting experiments in radio-telephony with those in this country, that the stations were ready, and that they were willing to co-operate upon receipt of an invitation from Great Britain, he would say whether that invitation would be extended; and, if not, for what reason.

Sir WM. MITCHELL-THOMSON said he had communicated with the Australian authorities and he understood that the Australian company had no stations which could undertake suitable radio-telephonic transmission to this country. Two-way experiments were therefore impracticable; but they had offered to receive the experimental transmissions from Rugby and to report their strength. He had informed them that he welcomed the offer, and he had furnished the necessary particulars of the Rugby transmissions. Unfortunately it had been necessary to suspend the Rugby experiments during the present emergency.

G.P.O. Services.—On June 8th, Col. DAY asked the Postmaster-General what was the estimated surplus or deficit on the postal, telephone, telegraph, and wireless services for six months.

Sir W. MITCHELL-THOMSON said that the estimated figures in respect of the six months ended March 31st, 1926, were as follows:—Postal services, surplus £4,229,000; telephone services, surplus £250,000; telegraph services, deficit, £774,000. The figures in respect of radio services were taken into account in estimating the total deficit of £747,000 for telegraphs. Separate figures for radio services for a recent period were not available.

London Electric and Metropolitan District Bill.—The Bill promoted by the London Electric and Metropolitan District Railway Companies came before the Unopposed Bills Committee of the House of Commons on June 11th. It was explained that the object of the Bill was to provide for the widening of lines, the installation of escalators and other works, at an estimated cost of £2,400,000, and to enable the companies to raise additional capital, not exceeding £1,000,000 in the case of the London Electric Railway and £500,000 in the case of the Metropolitan District Railway. The preamble was passed and the Bill ordered to be reported to the House for third reading.

Swindon Corporation Bill.—This Bill, which contains clauses empowering the Corporation to carry out wiring itself and to sell fittings and appliances, came before the Unopposed Bills Committee of the House of Commons on June 11th and was ordered to be reported to the House for third reading. By agreement a number of provisions to safeguard the position of local electrical contractors were inserted in the Bill.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Trade Names Supplement.—Along with our issue of next week we shall publish the first of a series of four Quarterly Supplements of Electrical Trade Names. These will contain the names and addresses of manufacturers and suppliers of a large number of electrical products and materials which bear special Trade Names. Each Supplement will be distributed free to every one of our 13,000 readers at Home and abroad, and will enable them to get into direct touch with the maker of any article included in the List.

The "Electrical Review" Index.—The Index to Vol. XCVIII (for the half-year ending June 30th, 1926), will be published shortly, and we shall be glad to receive the names and addresses of those who require it (free of charge) for binding purposes or wish to retain it for reference. Application should be made at once to the Publisher, 4, Ludgate Hill, E.C.

New Argentine Company.—The *Review of the River Plate* records the formation of the Cia. Feba de Electricidad in Buenos Aires, with a capital of $500,000 m/n, "to manufacture, import, and deal in electrical and sanitary machinery and articles in general." The company takes over an existing business.

E.D.A. Activities.—The British Electrical Development Association has published a folder containing reproductions of advertisements which appeared in daily, weekly and monthly papers, with a combined circulation of over 17 million per issue, during the period October, 1925, to March, 1926. The advertisements were specially designed for the various classes of journal in which they appeared and as a result their appeal was greatly strengthened and they must have performed a great deal of useful service for the electrical industry and the public at large.

Unemployment.—There was an increase of 16,521 in the number of registered unemployed during the week ended May 31st, bringing the total up to 1,614,200, as compared with 1,247,306 at June 1st, 1925. The total does not include persons who ceased work in the coal-mining industry on account of the lock-out.

A "Mazda" Display.—The accompanying picture shows a car which took part in a recent Shopping Week procession

A "Mazda" Display at Hendon.

at Hendon. It was arranged by Mr. C. E. Keates, a Hendon electrical contractor, and "featured" "Mazda" lamps in a very prominent manner.

Wages in the Engineering Industry.—The Federation of Engineering and Shipbuilding Trades held its annual conference in Bristol last week. Mr. W. Sherwood, in his presidential address, said a national strike was futile and wasteful, because it could never succeed. It could only be complete if all workers ceased to produce or distribute commodities, and that would result in terrible privation, if not starvation, for the poorer paid workmen with no reserves. If the discipline and enthusiasm shown in the general strike were directed to a closing of the ranks of labour, the abolition of differences between craft and labour organisations, and the establishment of a great and powerful trade union movement, the cost and sacrifice would be worth the effort. The conference decided to apply for an advance of 10s. a week on the existing rates of wages of all workmen engaged in the shipbuilding industry. Determination was expressed to get higher wages in the engineering industry, while it was hoped that satisfactory conclusions to the negotiations proceeding for an advance of 20s. a week would be reached.—*The Times.*

A Hotel Lighting Installation.—The First Avenue Hotel, London, has recently been re-opened after undergoing "spring cleaning" on a very large scale. It has been completely re-furnished and re-decorated and among the improvements carried out is a new lighting installation. Massive real bronze fittings and "Superlux" glassware designed and supplied by the General Electric Co., Ltd., and fitted with "Osram" gasfilled lamps are the leading feature of the instal-

The Lighting of the First Avenue Hotel.

lation in the main entrance and lounge. The entrance is illustrated in the accompanying figure. In other parts of the building similar elaborate fittings are employed. The main staircase is illuminated by ten "Unalux" fittings finished in gilt with decorated glassware. Over 1,000 lamps have been supplied, including 400 "White Osrams" and colour-sprayed lamps.

League's Assistance in Austrian Electrification.—In his latest report the Commissioner-General of the League of Nations for Austria states that in order to provide work for the unemployed on productive investments he has accelerated the rate of grants for this purpose. Included in the work is electrification for which two advances of 3,010,937 schillings and 3,643,950 schillings respectively have been made this year, bringing the total advanced for this purpose up to 12,193,950 schillings.

Portable Generating Set Contracts.—MESSRS. STUART TURNER, LTD., Henley-on-Thames, have received from the Air Ministry an order for a 1½-kW generating set for the triple purpose of general camp lighting, supplying searchlight current and low voltage current for battery charging. One generator supplies the three voltages and a special switchboard is mounted on the set. The engine is the standard type F.S.1 3-h.h.p. petrol engine made by the firm for its 1½-kW generating sets for country house lighting, the only difference being that aluminium is employed for the sake of lightness. The company has also received a further order for 80 small sets from the Post Office. These are for village automatic telephone exchanges. The Post Office has already installed over 200 of these sets.

Trade with Ireland.—We are informed that a movement is afoot among business men who are interested in trade with Ireland to form a special section of the London Chamber of Commerce for the sole purpose of furthering trade with the Free State and Northern Ireland. Further information can be obtained from the Secretary of the London Chamber of Commerce, 97, Cannon Street, E.C.4.

Electricity in the Balkans.—The Jugo-Slavian press agency "Sava" states that the municipality of Krouchevatz in Serbia, intends to construct an electric power-house in the town and that to this end it is open to receive tenders. It is calculated that the setting-up of this station will cost about eight millions of dinars (about £30,000). German, French, Austrian, and Swiss firms are all interested in projects for electrification in Jugo-Slavia.

Social Events.—The staff and employés of Messrs. A. Reyrolle & Co., Ltd., held their fifth annual sports meeting on June 5th at the company's own recreation ground; the attendance was approximately 2,000. Music was provided by the Hebburn Colliery Prize Band and the proceeds from the gate receipts are to be handed over to the Hebburn Infirmary. The prizes were presented by Mrs. H. W. Clothier. The Works Sports Management Committee, of which Mr. H. W. Miller is the chairman, arranged the programme, and attended to the comfort of the employés and their guests.

The Football Section of the General Electric Co.'s Sports Club held a dinner at Pritchard's Restaurant, W., on June 4th. Mr. L. C. Gamage presided, and he and Mr. M. Railing, who was also present, congratulated the teams on their successes during the past season. A number of speeches were made and an excellent musical programme was provided.

Local Exhibitions.—MANCHESTER.—The Electricity Committee has arranged for one of the electric houses on the Burnage Estate to be open for inspection by the public from June 14th to July 10th.

WEST HAM.—*Correction.*—We regret that our last week's note on the forthcoming electrical exhibition at West Ham, stated that it was being held during the current week, when in fact the show is not until September 13th.

ST. HELENS.—Mr. F. N. Rendell-Baker, the St. Helens borough electrical engineer, has sent us photographs of an exhibition which was arranged recently in the Y.M.C.A. Buildings, St. Helens. We reproduce one of these showing a comprehensive display by the General Electric Co., Ltd., in which practically every class of domestic appliance appeared.

The St. Helens Electrical Exhibition.

Our Foreign Trade.—The following were the values of imports and exports of electrical goods and machinery during May :—

	May, 1926.	Inc. or dec.	5 months, 1926.
Imports—	£	£	£
Electrical goods and apparatus	188,658	– 86,539	– 370,114
Machinery	1,049,459	– 15,974	+ 463,160
(Electrical machinery)	80,996	– 18,299	– 15,377
Exports—			
Electrical goods and apparatus	733,053	– 428,580	– 905,678
Machinery	3,184,520	–1,205,646	–1,536,688
(Electrical machinery)	425,183	– 121,555	– 204,032
Re-exports—			
Electrical goods and apparatus	8,938	– 19,710	– 41,491
Machinery	71,051	– 76,255	– 74,430
(Electrical machinery)	2,449	– 3,160	+ 6,411

The Amalgamated Engineering Union.—It is stated in its June *Journal* that the Union proposes to establish an "industrial section" which would cater for all classes of engineering workers over 16 years of age not at present eligible for membership of the Union.

Swedish Trade with Russia.—The *Board of Trade Journal* reports that the very considerable fall in Sweden's exports to Russia during 1925, due to the cessation of exports of locomotives, was partly offset by larger shipments of separators, ball bearings and electric generators. On the other hand, the exports of water turbines, which in 1924 were valued at 3.3 million kronor, were insignificant in 1925.

South African Electrical Imports.—The foreign trade statistics of the Union of South Africa for the year 1925 show that the imports of electrical machinery reached a value of £1,175,990, as compared with £1,078,114 in 1924.

"Your's the Companey"!—An electrical manufacturing company recently received the following application for employment. Comment would spoil so choice a specimen :—

"Dear Sir,

I have a very great pleasure of sending you this letter. For asking your settlement on the Electrical Sub Stations in all part of this Countrey in North Wales the Frawsfynudd Lake supply. Your's the Companey. Will you give me an opportunity of coming to this Electrical Works in this stations the nearest station to me is that station on a hill near Penrhyndeudraeth. I am live within 1½ M to the Station, I am very interesting in the Electrical Instrument, Electric Generator's.

"I am 20 years of age. I like to Apprentice with you i am in a study every night with Electrical Powers and so on. Well i must come to a close now with thanks i waiting for a letter soon from you

Yours trulley,

_____."

Trade Announcements.—The NON-FERROUS DIE CASTING CO., LTD., has removed its showrooms and offices to 36, Grosvenor Gardens, S.W.1.

The JEARY ELECTRICAL CO., LTD., of 26-28, Lambs Passage, Chiswell Street, London, E.C., announce that their business has now been reorganised. A trade price list of electrical accessories has been issued.

MESSRS. BRUCE, DAWSON & CO., 70, Finsbury Pavement, E.C.2, inform us that they are the agents in Great Britain, Ireland, &c., for the electric damping iron described in our issue of June 4th. The iron has been sold for some time past under the name "Elda."

Catalogues and Lists.—THE EDISON SWAN ELECTRIC CO., LTD., 123-5, Queen Victoria Street, E.C.4.—A pamphlet giving particulars and prices of "Ediswan" electric fans.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—June stock list of motors and dynamos.

MESSRS. SPENCER (MELKSHAM), LTD., Melksham, Wilts.—A brochure dealing with the company's goods-handling equipment.

MESSRS. GENT & CO., LTD., Faraday Works, Leicester.—Bulletin No. 34, containing particulars of "Pul-syn-etic" time-recording systems for works and offices, sirens, bells, &c.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—The "Osram Bulletin" for May, containing profusely illustrated descriptions of "Osram" lighting installations and dealing with the company's valves, fans, &c.

MESSRS. HENRY JENKINS & SONS, LTD., Vittoria Street, Birmingham.—Four catalogue sheets bearing illustrations and prices of canopy fittings for electric lighting.

THE HARLAND ENGINEERING CO., LTD., Alloa, Scotland.—Publication No. 507, describing a.c. motors complying with British Standard Specification No. 168/1923, ranging from 1 to 60 b.h.p., for general industrial purposes.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, Pa., U.S.A.—A series of illustrated leaflets dealing with air-break disconnecting switches, centrifugal oil separators, "Repel-Arc" furnaces, induction motors, baking ovens, and electric solder pots.

MESSRS. H. W. SULLIVAN, LTD., 368 & 369, Winchester House, E.C.2.—A comprehensive list of precision d.c. measuring and testing apparatus for laboratories and test-rooms. Fully illustrated and priced.

THE CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Road, S.W.1.—A mailing card showing the situation of the company's instrument repairing depots in Great Britain and Northern Ireland.

MESSRS. J. H. SANKEY & SON, LTD., Essex Wharf, Canning Town, E.16.—A booklet and postcard dealing with "Pyruma" plastic fire cement.

THE REES ROTURBO MANUFACTURING CO., LTD., Wolverhampton.—Pamphlet R.232, illustrating and describing in detail the company's self-contained pumping sets; and Pamphlet R.233, dealing with pumps for acid liquor and chemical trade liquids.

NEW PELAPONE ENGINE CO., LTD., 41, Baker Street, W.1.—Booklet No. 150 and Price List No. 152, containing particulars of the company's small generating sets.

MESSRS. HOUGHTON-BUTCHER (GREAT BRITAIN), LTD., High Holborn, W.C.1.—A price list of radio sets and accessories, including a "special bargain bulletin."

MESSRS. HICK, HARGREAVES & CO., LTD., Soho Iron Works, Bolton.—An illustrated brochure describing surface condensing plant incorporating the "Hick-Breguet" ejectair.

Bankruptcy Proceedings.—GEOFFREY MELLOR, 59, New Oxford Street, W.—This debtor attended at the London Bankruptcy Court on June 11th for public examination, upon accounts showing liabilities of £450 against assets valued at £379. He stated that from October, 1923, till November, 1924, he was employed as a traveller by Neutron, Ltd., a wireless company. In the last named month he commenced business as agent for manufacturers of radio apparatus at Vernon House, Sicilian Avenue, E.C., under the style of "Mellor." He obtained supplies of raw materials and sold them to Neutron, Ltd., who, in return, supplied "Mellor" with manufactured goods for sale on commission terms. Witness closed the business last August and acted as director of Detex, Ltd., which was then formed to deal in a crystal produced by himself. That company went into voluntary liquidation in February last. Since then he had been employed as manager of a limited company engaged in dealing in radio apparatus. He attributed his insolvency to his inability to collect moneys owing to him. The examination was concluded.

C. H. Patrick, 132, Much Park Street, Coventry, electrical contractor and wireless dealer.—The public examination of this debtor was held recently at the County Hall, Coventry. After questions had been put the examination was adjourned. Trustee, Mr. W. Hand, 12, Cherry Street, Birmingham, appointed June 2nd.

H. C. Hall, electrical and fancy goods dealer, "The Pantechnicon," 5, Chapel Street, Penzance.—First meeting held June 16th, at the Official Receiver's office, 12, Princes Street, Truro; public examination, July 19th, at the Town Hall, Truro.

R. Hampson (lately trading with A. Mearns as the Northern Supply Co., of Bolton), electrical engineer, Yew Tree Bungalow, Hall-i'-th'-Wood, Astley Bridge, Bolton.—Receiving order made June 8th, on debtor's own petition.

P. L. Symons, electrician, 4, Nelson Road North, and 4, Victoria Road, Great Yarmouth.—Trustee, Mr. C. B. L. Prior, Official Receiver, 9, Queen Street Chambers, Norwich, released, May 27th.

H. Tidswell (H. Tidswell & Co.), electrical engineer, 54, Trennant Road, Irlams-o'-th'-Height, and 11, Bazaar Street, Pendleton.—Last day for proofs for dividend, June 26th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

Company Liquidations. — Wainwright Manufacturing Co., Ltd., Walthamstow, E.17, wireless and electrical manufacturers, &c.—A meeting of creditors was held on June 10th, at the Institute of Chartered Accountants, E.C., when the chair was occupied by Mr. Vincent (Messrs. Vincent and Goodrich, C.A.), the liquidator of the company and the receiver for the debenture holders. A statement of affairs was presented which showed liabilities of £3,167, all due to unsecured trade creditors. There was a fully-secured creditor for £35 and debentures and interest amounting to £2,115. The net assets were £788, leaving an estimated deficiency of £2,378. The liquidator said that the company was formed to execute various contracts, and at the time of the incorporation no manufacturing was done. After about three years' trading the company decided to manufacture radio parts, and removed to Walthamstow. The first directors of the company were Mr. E. Wainwright and Mr. S. W. J. Vaisey. On December 6th, 1921, Mrs. Wainwright was appointed a director, and early in 1922 Mr. Vaisey resigned his position on the board, and Mr. H. A. Machin was appointed in his place. The liquidator said that the expenses had been far too heavy. In reply to questions he said that the wireless business had decreased very considerably during the last year; a patent table which the company had taken up was not the property of the company, but belonged to Mr. Wainwright and another gentleman. He (Mr. Vincent) was appointed receiver on May 25th, 1926. It was resolved to appoint a committee of inspection, consisting of the three principal creditors, to act with Mr. Vincent in the voluntary liquidation of the company.

The following are creditors:—

	£		£
Siemens & English Electric Lamp Co., Ltd.	483	Barnes, C. A.	53
Siemens Bros. & Co., Ltd. ...	432	Davis & Timmins, Ltd.	49
Hervé, L., Ltd.	261	Ryman, H. J., Ltd.	47
Wilson, J. R.	174	Streeter, J.	45
Walton Harvey Ltd.	159	Moy, E. F., Ltd.	41

Birkbys	54	Burnham & Co.	21
Benjamin Electric, Ltd.	53	*Wireless Dealer*	21

B.M.A.S., Ltd., Ashburton Road, Old Trafford, Manchester.—The first meeting of creditors was held on June 7th, at the Official Receiver's Offices, Manchester. According to the statement of affairs the gross liabilities as regarded creditors were put down at £35,840, against total assets of £10,829, leaving a deficiency of £25,011. As regarded contributories the deficiency was estimated at £47,211. The failure of the company was attributed to a falling off in the demand for accessories. The company was incorporated privately in January of last year, to carry on business as manufacturers of electrical ignition apparatus and meter accessories, with head offices and works at the above address, and with depôts for sales and repairs in 11 places in England and Ireland. It was formed to continue the business previously carried on by another company. The total debenture issue was £24,000 and the amount owing to the bank was £24,401. The Official Receiver expressed the opinion that further inquiry into the formation of the company and of the conduct of its business was desirable. The case was left in the hands of the Official Receiver with a committee of inspection.

Bristol & South Wales Electric Welding Co., Ltd.—Winding up voluntarily. Liquidators, Mr. J. W. Williams and Mr. P. Jones, 5, St. Andrew's Crescent, Cardiff. A meeting of creditors is called for June 21st at the offices of the Liquidators. Particulars of claims by July 28th.

Frank Craft (Castleford), Ltd.—Meetings of creditors and contributories June 22nd, at the Official Receiver's office, 21, King Street, Wakefield.

Lydbrook Cables, Ltd.—Winding up voluntarily. Liquidator, Mr. F. V. Hasemore, 123, Queen Victoria Street, E.C.4. Particulars of claims to the Liquidator by June 25th.

Southern Radio Supplies, Ltd.—A meeting of creditors was held on June 9th, at the offices of the liquidator, Mr. P. M. Jones, Terminus Road, Eastbourne.

Private Arrangements.—T. W. Brooks, trading as Brooks and Clayton, electrical and wireless engineer, 72, Belgrave Road, Leicester.—A meeting of creditors was held recently, when a statement of affairs was submitted which disclosed liabilities of £489, all due to the trade. In addition, there were fully secured creditors for £348, who held securities valued at £360, leaving a surplus of £11. The net assets amounted to £615, leaving a surplus of £125. It was stated that the assets were shown on the basis of a going concern and were subject to realisation and costs. Further adjustment might also be necessary. Mr. Brooks commenced business on his own account in June, 1922, with £30 capital. In 1924 Mr. Clayton joined him in partnership, putting £140 into the concern, while Mr. Brooks put in a further £130. In November, 1925, Mr. Clayton left the business. A full set of books had not been kept until this year. It was resolved that a committee of inspection should be appointed consisting of Messrs. Gilbert & Co. (Sheffield), Mr. Tames (E. H. Wood, Leicester), Messrs. Wathes & Co., Ltd., and Mr. C. Latham, of the Wireless & Radio Trades Guardian Association.

J. F. Dare, ironmonger, wireless and electrical engineer, 4, The Parade, Tadworth.—The creditors interested herein were called together on June 8th, at the offices of Messrs. Theodore Bell & Co., London, E.C., when Mr. Bell reported that the liabilities to unsecured creditors amounted to £525, and there were preferential and other claims amounting to £40. The assets consisted of book debts £13 and stock valued at £300. Mr. Bell added that there was a cash creditor for £250, but in the event of the estate being dealt with privately that claim would be withdrawn. The debtor said that he had been in business about 12 months. He had kept no books. He attributed his position to losses on trading chiefly in the radio trade, having installed sets and guaranteed them for six months. It was decided that a committee of creditors should be appointed and endeavours made to sell the business as a going concern.

W. Lanham Mays, 91, Southampton Row, W.C., electrical engineer.—A meeting of creditors was held on June 11th, when Mr. W. A. J. Osborne presented a statement of affairs which disclosed liabilities of £655 and net assets of £118, leaving a deficiency of £537. Mr. Osborne reported that the debtor started business in partnership with a Mr. Short in 1920. He borrowed £250 from his brother and opened offices in the Strand, and also at Tottenham. In 1922 Mr. Short retired from the business. The loan of £250 was repaid, but in March, 1925, was borrowed again in order to enable the debtor to start his present business. The turnover since March, 1925, had been approximately £1,500, and the debtor estimated that he had made roughly 20 per cent. profit. The expenses were £259, and the debtor had been drawing at the rate of £500 per annum. There were no private assets. It was resolved that the debtor should execute a deed of assignment in favour of Mr. W. A. J. Osborne as trustee, provided the cash creditors withdrew their claims.

The following are creditors:—

	£		£
Alliance Wholesale Electric, Ltd.	73	Sloan Electrical Co.	83
Metro-Vick Supplies, Ltd. ...	65		

Dissolutions of Partnership.—Allan & Meggitt, electrical engineers, Canford Hall, St. Peter's Road, Bournemouth.—Mr. J. C. Allan and Mr. S. T. Meggitt have dissolved partnership. Mr. Meggitt will attend to debts and continue the business in his own name.

Reading Radio Installations, dealers in radio supplies, 17, King's Road, Reading.—Mr. A. Williams and Mr. A. Phillips have dissolved partnership. Debts will be attended to by Mr. Phillips, who will continue the business.

Lewis & Mayer, electrical engineers and contractors, Subway Road, Barry Dock, Glamorgan.—Mr. H. E. B. Lewis and Mr. E. T. Mayer have dissolved partnership. Mr. Mayer will attend to debts.

Lead.—In their report dated June 12th, Messrs. James Forster & Co. stated that considerable buying by cable makers caused the firmness in tone early in the week:—"Apart from the lead already in warehouse, the position of supply and demand seems to be pretty evenly balanced. Consumption in this country is of course being curtailed by a shortage of fuel, but, on the other hand, this is being made up for by a better demand from the Continent, there being a shortage of lead in Germany. A satisfactory settlement of the coal dispute and normal fuel supplies for consumers here would probably bring out a good demand for lead, particularly for near delivery, and it is doubtful whether there would be enough lead arriving within the next month to meet this demand. On the other hand, it must not be forgotten that there is plenty of lead in warehouse and this would no doubt make its appearance on any sign of a shortage of arrival lead."

Syrian Customs Duties.—The *Board of Trade Journal* states that by a recent decree the rates of Syrian import duties on most goods were increased. The date of the coming into force of the new tariff has been postponed until July 1st. The duties generally are increased from 15 to 25 per cent. *ad valorem* but a number of specific rates have been instituted. These include a duty of 40 piastres (gold) per hundred on electric batteries for pocket torches.

Irish Free State Electrical Imports.—The imports of electrical goods, excluding machinery, into the Irish Free State during April last amounted to £30,312, as compared with £25,785 in the same month a year ago. The imports for the first four months of the year are officially returned at £159,499, as against £99,189 in the corresponding period of 1925.

The Licensing of United States Contractors.—All master electricians doing wiring in the city of Kingston, N.Y., now have to file a $500 indemnity bond, pass an examination and pay a $10 licence fee. This is provided for in an amendment to a city ordinance, passed by the Board of Fire Commissioners of the city on April 13th. The Board of Examiners, which will pass on the qualifications of electricians applying for licence, will be composed of the chief of the Fire Department and two members appointed by the president of the Fire Commissioners.—*The Electragist.*

Book Notices.—"Electrical Contracting," by H. Ayres Purdie. Pp. xxxii + 371; figs. 186. London: Ernest Benn, Ltd., 1926. Price, 10s. 6d. net.—The data and information required by the average electrical-contractor is of a varied nature and is usually to be found scattered in a number of publications. The author has made an attempt to put all the necessary information under one cover and the result, in the form of the above book, should prove useful to the electrical contractor, particularly to the man in a small way of business who is employed most of the time on ordinary domestic installation work, but occasionally has to meet conditions where unusual data are required, the small amount of such work not enabling him to draw up the necessary particulars for his own use. The work is divided into six parts, the first of which is devoted to the organisation of an electrical contracting business and should be of value to the contractor when first starting. Many useful suggestions are made concerning capital and credit, business registration, works orders, the requisition of materials, costing, &c. Considerable space is given to the question of advertising and salesmanship, and also to the drawing up of estimates and specifications. The second part, administration, deals with the control of the staff, the issuing of orders and the adherence to the rules and regulations laid down by authoritative bodies such as the Institution of Electrical Engineers. The remaining chapters are concerned with the actual work done by contractors. The various systems of wiring, with recommendations for particular installations, are outlined and many types of apparatus are described and illustrated. A number of diagrams of connections and wiring for installations and apparatus are also included. In an introduction to the book, Mr. J. C. Elvy, A.M.I.E.E., says: "I know of no other single book covering so much ground in electrical contracting work."

The Association of "Old Cromptonians" (Mr. M. Whitgift, hon. sec.), has issued a neat brochure dated May, 1926, containing a list of members, amusing "cataclysms" by J. W. Meares, and "Chelmsford Notes."

"Memoirs of the College of Engineering," Kyoto Imperial University. Vol. IV, No. 2, March, 1926. "The Fatigue of Steel and its Recovery," Part I.

Catalogue of the Collections in the Science Museum, South Kensington. Electrical Communication.—1. "Line Telegraphy and Telephony." Compiled by R. P. G. Denman, M.A., A.M.I.E.E. Pp. 55, illustrated. H.M. Stationery Office. Price 9d. net.—Descriptive and historical notes accompany the items, many of which are illustrated.

Receiver Appointed.—A receiver and manager has been appointed in the Acme Production Co., Ltd., Britannia Works, Engine Street, Smethwick, Birmingham. A meeting of creditors will be held on June 22nd at Queen's Hotel, Birmingham.

Swiss Loan for Bavarian Works.—The *Financial News* reports that the Lech Electrical Works of Augsburg, Bavaria, has placed in Switzerland through a financial group headed by the Bank for Electrical Enterprises, Zurich, a loan of 12,000,000 Swiss francs. The loan bears interest at 7 per cent., and is redeemable within twenty-five years. For the present there will be no public issue.

Lighting and Power Notes.

Adwick-le-Street.—SUPPLY DURING THE STRIKE.—The Urban District Council has rejected the request of over 150 householders at Skelton, near Doncaster, that their supply of electricity should be discontinued during the coal stoppage. The houses occupied by the applicants are supplied with unlimited energy at a weekly charge of not more than 1s. 7½d. per week. The chairman of the Electricity Committee said that applicants were acting within their rights under a clause which said that if a consumer wished to cease taking a supply 24 hours' notice must be given. The Clerk agreed that in law the applications might be in order, but he did not advise that the request be granted. It was pointed out that if permission were given it would be followed by applications during the summer for supply to be discontinued, followed in the winter by requests for renewal.

Australia.—TUMUT.—The *Sydney Morning Herald* reports that the Minister for Works has informed a deputation from the Tumut Municipal Council and the Gadera Shire Council that within a few years the waters of the Tumut Valley would be required as part of the Burrinjuck hydro-electric scheme. Preliminary steps have already been taken for the establishment of a power-house on the Gilmore Creek, near Tumut, to link up with Burrinjuck. The Minister has been informed that a Melbourne company is prepared to spend £1,000,000, and also to supply electricity at a ½d. per kWh.

CASINO.—The new power station at Casino was officially inaugurated in May by the Mayoress, Mrs. Elesmer Jones.

Bangor.—APPLICATION FOR LOAN.—Application is being made by the Corporation to borrow the sums of £3,000 for expenditure on mains and services and £800 for meters.

Barnstaple.—LOAN.—The Town Council has applied for sanction to borrow £3,500 for prospective capital expenditure in connection with the electricity undertaking during the next twelve months.

Bedwellty.—APPLICATION FOR LOAN.—The Urban Council has applied for a loan of £7,945 for electricity purposes.

Billericay.—INSTITUTION LIGHTING.—The Board of Guardians has applied to the Ministry of Health for sanction to a loan of £4,259 for the installation of electric lighting at the new hospital and the institution.

Blackburn.—BULK SUPPLY.—The Mid-Lancashire Electricity Board has made an effort to effect an extension of the existing bulk supply agreement between the Blackburn and Darwen Corporations, but without success.

Bradford.—LOAN.—The Electricity Committee has asked the City Council to approve an application for sanction to borrow £150,000 to meet estimated expenditure on mains and services during the next three years.

STREET LIGHTING.—A special sub-committee appointed some time ago to review the street lighting situation has received a report from Mr. J. F. Colquhoun, street lighting engineer of Sheffield, and vice-president of the Institution of Public Lighting Engineers, who was called in as consultant to examine the street lighting system and give advice on methods of improvement. A feature of the report is a recommendation that gas lighting be replaced by electricity on the main tramway routes. It is recommended that a street lighting engineer be appointed and that the remaining gas lighting be automatic. The sub-committee has accepted the recommendation that a street lighting engineer be appointed, and offers £500 per annum.

Burton-on-Trent.—YEAR'S WORKING.—We have received from Mr. T. Hall, borough electrical engineer, a copy of his report together with the statement of accounts of the electricity undertaking for the year ended March 31st last. The total revenue amounted to £94,937, as compared with £87,559 in the preceding year. Working expenses were £46,498, as against £46,502, leaving a gross profit of £48,440 (£41,058), to which was added a sum of £229 from house rentals, making a total of £48,669 available. After providing for capital charges there was a net surplus of £15,153, of which £2,000 was contributed to the borough fund and the remainder transferred to renewals fund. Reductions in the charges equivalent to a revenue of £5,000 were made during the year. The sales of electrical energy amounted to 15,628,445 kWh, an increase of 2,136,648, and the average price obtained fell from 1.51d. to 1.42d. The maximum supply demanded rose from 4,450 to 5,500 kW. During the year the districts of Swadlincote and Overseal were added to the distribution system.

Cheltenham.—OIL FUEL.—The Electricity Committee has authorised the borough electrical engineer to purchase 50 tons of fuel oil and to make any necessary alterations to the boilers for using the fuel with a view to maintaining as full a supply to consumers as possible during the coal dispute.

Chesterfield.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction for a loan of £5,50 0for the provision of rotary converter plant.

Colombia.—CARTAGENA.—The electricity undertaking recently erected at Cartagena has successfully passed the boiler and turbine tests, and is to be taken over by the municipality of Cartagena.

Continental.—FRANCE.—The Paris correspondent of *The Times* reports that a new hydro-electric power station was inaugurated on June 5th at Eguzon, on the Creuse, in the Department of Indre, some 200 miles from Paris. Here the river has been dammed with a barrage of reinforced concrete, 200 ft. high, and a lake formed containing 72,000,000 cu. yd. of water. The water, passing through pipes 13 ft. 9 in. in diameter, drives five turbines each of 10,000 kW. The 10,000-V energy is transformed up to 90,000 and 150,000 V and is conveyed towards Paris by two lines with numerous sub-stations at intervals, at which the voltage is reduced to 1,500 for traction on the Orleans Railway. It is hoped to save 250,000 tons of coal a year. During slack hours on the railway there will be 20,000 to 30,000 kW surplus available for Paris.

A new 10,000-kW steam turbo-generator has recently been added to the power station at the collieries of the Compagnie des Mines d'Anzin in Northern France.

BULGARIA.—Work has recently commenced on the establishment of a new central power station in Sofia by the Compagnie d'Electricité de Sofia et Bulgarie. Since 1915 the number of consumers has increased from 7,900 to 23,400, and last year the company supplied 14,605,600 kWh, as against 12,637,100 kWh in 1924. A 35,000-V transmission line is being erected between Sofia and Kourilo, a distance of about eight miles.

SWITZERLAND.—Some further particulars of the new Ryburg-Schworstadt super power station which is to be established on

the Rhine as a joint enterprise of the Baden (Germany) Provincial Electric Supply Co., and the North East Swiss Electric Power Co., were given at the recent annual meeting of the Rheinfelden Electric Power Transmission Co. The new plant is to have an eventual capacity of 110,000 h.p., the cost of construction being estimated at £2,400,000.

The Lac de Joux Electric Power Co. has decided on the establishment of a large new power station at an estimated cost of £200,000 with the objects of meeting the increasing demand in the district and also to "export" electricity to France.

CZECHO-SLOVAKIA.—The South Slovakian Electricity Co., of Komarno, which is to supply electricity to a large area in the south of Slovakia, has been formed with a capital of 8,000,000 crowns. Of this the Czecho-Slovakian Government has subscribed 3 million crowns while the remainder has been taken up by the local authorities in the districts to be served by the company. The State is erecting the main power station at its own expense, and will lease to the company for a period of 30 years.

Darlington.—INQUIRY.—An inquiry was held on June 8th by Col. E. T. C. Ekin, Inspector for the Electricity Commissioners, into an application by the Corporation to extend its area of electricity supply so as to include parts of the rural districts of Croft and Darlington. For the Corporation it was stated that it was intended to supply a ring of parishes immediately adjoining the borough boundary which were close to the electricity works. The Corporation was prepared to lay mains in roads and villages where the demand for a supply was satisfactory. The scheme was opposed by the Rural Councils concerned, who demanded that compulsory mains should be laid in certain villages covered by the Corporation's application. The Commissioners' decision will be given in due course.

Darwen.—APPLICATION REFUSED.—An application by the Darwen Corporation for permission to extend its electricity plant by the installation of a 2,000-kW turbo-alternator and one Lancashire boiler has not been granted.

REDUCTION OF CHARGES.—The reduction of the charges for electricity by the Darwen Town Council amount to a total of over £2,800 per annum.

Dover.—YEAR'S WORKING.—The financial statement of the working of the Electricity Department (engineer: Mr. R. C. Harpur) for the year ended March 31st, 1926, records a total income of £55,817, as compared with £52,229 for the previous year. The working expenses amounted to £25,964, as against £28,526, leaving a gross profit of £29,853 (£28,526). The reduction of capital costs, &c., leaves a net balance of £9,253, as compared with £2,023 for 1924-25. The capital expenditure during the year amounted to £14,123, bringing the total up to £296,445. The total kWh sold during the year was 3,070,884, a decrease of 5.04 per cent. on the number for the previous year. The average price per unit amounted to 4.36d.

Gravesend.—ELECTRICITY SUPPLY.—The Electricity Committee has passed estimates of £2,300 for rectifier equipment at Old Road sub-station and £2,000 for h.p. mains to the station from the electricity works.

The Electrical Engineer reports that the cost of providing a supply of electricity to the Tollgate will be approximately £3,000.

Great Yarmouth.—ELECTRICITY IN BULK.—The Electricity Committee is to submit to Lowestoft Corporation terms upon which it would be willing to give a bulk supply of electricity, and a sub-committee has been appointed to confer with the Corporation on the subject.

Hastings.—EXTENSION OF SUPPLY.—The Town Council has decided to extend the mains for the supply of electricity to the housing estate at Broomgrove and for public lighting at an estimated cost of £2,390.

Hazelgrove and Bramhall.—LOAN.—The Urban District Council has applied for sanction to a loan of £1,500 for meters.

Heckmondwike.—SUPPLY RATIONING.—The District Council is rationing its electricity supply to industries, preference being given to food supplies and essential services.

Ilford.—LOAN.—The Urban District Council has applied for sanction to a loan of £5,820 for electricity purposes.

Loughborough.—EXTENSION OF SUPPLY.—A scheme for the extension of its electricity supply to the Nanpantan suburb has been adopted by the Town Council, and application is to be ade for sanction to borrow £3,850. An 11,000-V cable is to be laid partly underground and partly overhead, and a sub-station provided with a 100-kW transformer.

Luton.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to the borrowing of £5,000 for meters and overhead mains.

Middleton.—NEW PLANT.—The Town Council has decided to purchase a 1,000-kW converter for £4,360, and has authorised application for sanction to borrow £5,860 for equipment, &c.

Northern Ireland.—BELFAST.—The Corporation has decided to apply to the Electricity Commissioners for Northern Ireland for sanction to a loan of £110,500 for electricity supply extensions

Plymouth.—PLANT EXTENSIONS.—The Electricity Committee of the Corporation has placed an order for a 7,500-kW generating set, the cost, with auxiliaries, being £35,000. The set is to be installed at the Prince Rock station.

Shelf.—BULK SUPPLY.—It is reported that the electricity supply from the Electrical Distribution of Yorkshire, Ltd., is to be available by the end of June.

Shrewsbury.—LOANS.—The Electricity Committee has decided to apply for sanction to the borrowing of £7,000 for mains and £3,000 for services.

Spalding.—UNDERGROUND CABLE.—The Council is to lay underground cables in preference to erecting overhead transmission lines for the supply of electricity in bulk from the Peterborough Corporation, which is expected to be available next March. Tenders for the supply of cable are to be invited.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Electrical Distribution of Yorkshire, Ltd., to supply electricity in the urban districts of Denby, Denby and Cumberworth, Dodworth, Gunthwaite and Ingbirchworth, Hoylandswaine, Shelley, Shepley, Stocksbridge, Thurlstone, Baildon, Denholme, Queensbury, Shelf, and Southowram, and parts of the rural districts of Barnsley, Penistone, and Wharfedale; and Messrs. Crompton & Co., to supply in the urban districts of Seaford and Newhaven, and part of rural district of Newhaven.

Application has been made to the Commissioners by the Urban District Council of Barnoldswick for a Special Order authorising it to supply electricity in the urban district.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Electrical World* the Federal Power Company of Knoxville, Tenn., has applied to the Federal Power Commission for a preliminary permit covering a proposed development on the Nolichucky-Toe Rivers near the North Carolina and Tennessee lines. The primary power to be made available is estimated at 27,800 h.p. The applicant proposes, however, to install 72,000 h.p. The power is intended for public utility service and for use by the electrochemical industry.

The Pacific Gas and Electric Company has in hand a scheme for supplementing the output of its Electra plant. It is proposed to construct a reservoir at Salt Springs, in the Sierra Nevada Mountains, 3,800 ft. above the sea level. The water will be conveyed 23 miles by canal and tunnel to Tiger Creek, where it will fall 1,200 ft. to a new power house of 47,000-h.p. capacity. After passing through the generators of Tiger Creek power house the water will be carried on to the 27,000-h.p. Electra plant, which has lacked sufficient water supply to operate at full capacity in the summer months. The new development will cost about $10,000,000.

Wimbledon.—YEAR'S WORKING.—We have received from the engineer and manager of the Electricity Department (Mr. A. E. McKenzie) a copy of the report of the working of the undertaking for the year ended March 31st last. The total revenue for the year amounted to £130,987, as compared with £116,147 for the previous year. The generating costs for the period in question amounted to £33,696, against £34,460. The net profit of the concern for the year was £33,505 (£23,971). During the year the maximum load on the station increased from 5,280 kW to 6,300 kW. The units sold amounted to 13,586,008, of which 4,520,588 were used for heating and cooking. The average price per kWh was 2.18d., compared with 2.38d. for the year 1924-25. The works costs per unit sold were 21.35 per cent., the total inclusive costs 14.66 per cent., and the coal consumption per kWh was 14.2 per cent. lower than in the previous year. Twenty-eight miles of cable was added to the distribution system during the year.

Tramway and Railway Notes.

Australia.—RAILWAY ELECTRIFICATION.—The South Australian Premier announced recently that the Government has decided on the electrification of the Glenelg railway, which will be the first undertaking of its kind in the State. The Municipal Tramways Trust will supply the electricity and it is expected that the work will be completed in eighteen months. The Premier said that after investigations extending over three years, it had been decided that the most economical method of operating the North and South Terrace lines between Adelaide and Glenelg was by electric traction.—*Reuter's Trade Service* (Melbourne).

Bradford.—THROUGH-RUNNING TICKETS.—The Tramways Committees of the two Corporations are negotiating with a view to issuing through tickets on the Bradford Corporation tramways and the Keighley Corporation motor-'buses, the connection of the two systems being at Cross Flatts.

LOAN SANCTIONED.—The Tramways Committee has received sanction to a loan of £48,000 for track renewals.

Continental.—ITALY.—The tramways between Mantova and Asola and between Mantova and Viadana are to be electrified.

HOLLAND.—A change from a.c. to d.c. has recently been made on the electric railway between Rotterdam and The Hague. The Rotterdam-Scheveningen trains running partly over the same lines are still steam-operated, but it is expected that the line will shortly be completely electrified. Good progress is

also being made with the electrification of the main line between Amsterdam, Haarlem and Rotterdam, and work is expected to be completed next year.

SWITZERLAND.—The report of the working of the Swiss Federal railways during 1925 shows that the output of the Amsteg-Ritom power station last year amounted to 143 million kWh, of which 139 millions were utilised for train haulage purposes. The output shows an increase of about 30 million kWh over 1924, this being due to the completion of the electrification work on the Zurich-Olten, Zurich-Winterthur and Olten-Berne sections. The output of the Barberine power station advanced from 9 million to 23 million kWh, the increase in this case being due to the completion of the electrification work on the Lausanne-Yverdon, Daillens-Le Day and Renens-Geneva sections.

DENMARK.—What is stated to be the first railless electric trolley motor-'bus service in Denmark is shortly to be started in Copenhagen. It is stated that the order for the chassis of the vehicles has been placed in England, while the bodies are to be built in Denmark.

Dewsbury.—COAL CONSERVATION.—With a view to preserving its coal stocks, the Corporation has reduced its tramway services by about 25 per cent.

Leeds.—OIL FUEL.—To help in conserving the decreasing coal supply some of the boilers at the tramway power station at Crown Point are now being partly fired by oil fuel. If and when all the coal reserves are exhausted the boilers can be fed entirely by oil. The plant installed for this purpose during the last mining crisis has been left intact for a repetition of such an emergency.

Liverpool —RESTRICTED AND RESTORED SERVICES.—Following a restricted supply of electricity for power and tramways during the previous few days, the Liverpool Tramway and Electric Power and Lighting Committee on June 4th authorised a full supply of electrical energy for power purposes and a normal tramway service.

London.—MORDEN LINE COMPLETED.—According to *The Times*, the new tube railway from Clapham Common to Morden, which has been constructed at a cost of nearly £3,000,000, has been completed, and it is expected that it will be opened next month. The new railway, which is an extension of the underground system, will serve a population of about 300,000 people. All that is now required is the completion of the electrical equipment and signals. The stations have all been constructed, and the rolling stock has been delivered. Of the five miles of track between Clapham Common and Morden, the first 4½ miles are underground. The remaining half-mile, from Dorset Road to Morden, has been constructed on the "cut and cover" principle, and the railway runs into the open at Morden Station

TRAIN INDICATORS.—Train destination indicators which automatically show passengers the destination of the next train and of the two succeeding trains are to be introduced on the tube lines. These indicators are now being installed on the platforms at Leicester Square, Tottenham Court Road, Charing Cross, Kennington, Euston, Bank, Moorgate, Waterloo and Morden stations, and will be available for use in about a month's time.

Persia.—TEHERAN.—*Commerce Reports* states that the electrification of the horse-tramway system of Teheran has been proposed, and pressure is being brought by the Government upon the Belgian company holding the concession. The company has advised the Government of its willingness to make the change, but suggests that the cost would be prohibitive unless permission to transport materials through Russian territory is secured by the Persian Government.

Sheffield.—TRAMWAY EXTENSION.—The Tramway Committee has prepared a scheme for the extension of the tramway from Millhouses to Beauchief at a cost of £99,000.

Sunderland.—YEAR'S WORKING.—We have received from Mr. A. R. Dayson, manager and engineer of the Tramways Department, a copy of the annual report for the year ended March 31st, 1926. The total income for the year is shown as £124,416 and the working expenses as £99,202, leaving a gross balance of £25,214. After the payment of capital charges, &c., a net balance of £14,068 is left. The car miles run amounted to 1,652,221, the passengers carried to 29,792,834, and the number of units used per car mile was 1.3. During the year £20,346 was spent from the capital account, bringing the total capital expenditure up to £365,750.

TRACK EXTENSION.—The Town Council has decided that the single line of tramway track near the Grangetown terminus shall be doubled, at an estimated cost of £7,000.

Walsall.—YEAR'S WORKING.—The statement of accounts for the tramway undertaking (manager and engineer: Mr. W. Vane Morland) for the year ended March 31st last records a total income of £135,698, of which £80,407 was received from the tramway services and £55,291 from the motor services. The total working expenses amounted to £119,374; tramway, £72,057; and motor, £47,317, leaving a net revenue of £16,324 (£8,350 and £7,974). A total of £6,000 is being given to the relief of rates. The net car mileage on the tramway system amounted to 1,011,544, the passengers carried being 11,800,137. The energy consumption per car mile amounted to 1.471 kWh.

St. Helens.—TRACK RENEWALS.—The borough engineer has submitted to the Tramway Committee a scheme for relaying the tramway track in Corporation Street, Cotham Street, and Shaw Street, and laying track in Station Road and Ormskirk Street, at a total estimated cost of £14,900.

Telegraph and Telephone Notes.

Anglo-Norwegian Cables.—AGREEMENT TERMINATED.—In 1911 the British and Norwegian Governments jointly acquired the Great Northern Telegraph Co.'s cable between Scotland and Norway, but by arrangement with the Post Office the working in Great Britain both of this and of a duplicate cable laid by the two Governments remained in the hands of the Company. The remuneration received for the working of these cables has gradually become insufficient, and the Company has therefore been compelled to terminate the arrangement as from the middle of May last, when the General Post Office itself took over the working of the cables.

The recently-issued report of the Great Northern Telegraph Co., Ltd., for 1925 shows that about 4,968 nautical miles of cable are now being operated in Europe and approximately 3,453 miles in the Far East. By strengthening and renewing all weak sections, the Company's cables have been maintained in excellent condition, the number of breaks repaired during 1925 showing no increase as compared with previous years. In Europe 26 breaks were repaired in 10 cables, and in the Far East 22 breaks in eight cables, apart from which six shore ends were renewed in the Far East.

Brazil.—NEW RADIO STATION.—The new high-power wireless-telegraph station at Rio de Janeiro, which was opened recently by the Brazilian Minister of Communications, has been equipped with a 20,000-metre-ampere valve transmitter by Marconi's Wireless Telegraph Co. The station is being used for telegraph communication by radio between Brazil and Europe, Africa, Australia, North America, and the other countries of South America.

Germany.—WIRELESS ON RHINE STEAMERS.—Permission has now been accorded by the Inter-Allied Rhineland High Commission for the use of wireless transmitters and receivers on Rhine steamers when passing through "occupied territory." Certain conditions are attached to the permission: The maximum wave-length permitted is 600 metres, and the capacity of transmitters may not exceed 250 watts; all apparatus must be registered with the Post Office and an accurate description deposited with the authorities.—*Reuter* (Cologne).

India.—AUTOMATIC TELEPHONY.—Our special correspondent reports that, owing to a number of disadvantages now disclosed in the working of the automatic telephone system, the Government of India has abandoned its intention of extending the system to places where it has still to be introduced. The principal defect found is that the system requires intelligent operation and mishandling is likely to result in wrong numbers being obtained, the subscriber having to pay for his mistake. On this account the system is not considered to be quite suited to India. Wherever automatic instruments have been introduced, they have become unpopular. Even the economy vouched for when the system was being introduced has not materialised, because, though it was expected that by reason of the reduction in the number of operators, money would be saved, it has been found necessary to employ expert and highly-paid supervisors to attend the more complicated adjustments inseparable from the automatic system. The care needed to "dial" a number often proves too exacting for the average user in India.

The Telephone Service.—LAST MAGNETO EXCHANGE.—The "Bank" telephone exchange rang its own death knell on June 5th. It was the first London exchange to be fitted with a multiple switchboard, and the last to be worked on the "magneto" principle, which obsolete method of calling the attention of the operator by turning a handle and ringing a bell has now passed for ever. In point of numbers, "Bank" was the smallest of the London exchanges, having less than 1,000 subscribers, who will now be transferred to the "Central" exchange.

Telegraph Regenerator.—NEW CABLE DEVICE.—Sir John Denison-Pender, in his speech to the shareholders of the Eastern Telegraph Co., mentioned that during the past year an invention of the staff of considerable importance had been installed upon certain of the Company's cables, and would be on practically all its cables so soon as the necessary apparatus could be made. It was termed a "regenerator," and overcame the disabilities inherent in the old system of relaying from one cable into another cable, which did not permit of successful operation of a chain of cables, except at greatly reduced speeds, owing to distortion of signals both in the cables and in the relay apparatus, which distortion became cumulative. The regenerator, which had been installed on the London-Porthcurnow-Carcavellos-Gibraltar cables for over eight months, had increased the speed by over 35 per cent. The additional gain in traffic-carrying capacity due to reduction of stoppages and improved working amounted to 13 per cent., making the total gain on this section over 48 per cent. It had also just been installed on the Gibraltar-Malta-Alexandria station 3 section with improved carrying capacity of 27 per cent. Efforts were continuously being made on other circuits to increase speeds, and, as an instance of the results achieved, the present speed in and out of London on the Company's cables was 23 per cent. in excess of that existing in 1922.

Radio Notes.

Australia.—WIRELESS CONFERENCE.—At inter-State conference was held recently at Sydney, at which animated debates took place on the subject of licence fees and the future control of wireless in Australia. After a prolonged discussion it was recommended that the Federal Ministry should be asked to appoint an advisory board to assist in the administration of broadcasting regulations. Spirited discussion followed a proposal that a Royal Commission be appointed by the Government to consider the advisability of confining the commercial broadcast wave-length in Australia within the standard length of from 200 to 600 metres, but it was eventually decided to take no action with regard to wave-lengths. The conference decided to ask the Federal Postmaster-General to increase generally the margin of wave-length between the stations 4QG (Queensland), 2BL (New South Wales), 3LO (Victoria), 3AR (Victoria), and 5CL (South Australia).—*Reuter's Trade Service* (Melbourne).

Licences.—STILL INCREASING.—Answering a question in the House of Commons, the Postmaster-General (Sir W. Mitchell-Thomson) said the total number of wireless licences at present in force in Great Britain and Northern Ireland was about 2,050,000.

New High-power Station.—DAVENTRY TESTING PLANT.—A new high-power broadcasting station is in course of construction at Daventry for the purpose of experimenting in the direction of making alternative programmes available to a wide circle of listeners provided only with simple receiving sets. The object of the British Broadcasting Co. is to see how far it is possible to provide such programmes without interfering with the existing services of the Government, the Army, the Navy, and the Air Force. The experiments will probably be carried out in the early hours of the morning, and no public programme will be issued from the new station. The strength of the station is to be from 10 to 15 kilowatts, and it is not to be an addition to the present series of stations, but simply for experiments on the ordinary broadcast wave band.

Venezuela.—BROADCASTING SITUATION.—The Empresa Venezolana de Radiotelefonia was formed towards the latter part of 1925 for the purpose of broadcasting entertainments, news, lectures, &c., and to import, construct, sell, rent, and maintain all classes of broadcast radio receivers. The broadcasting station is provided with a 1-kW transmitter, and an aerial supported on two 165-ft. lattice-steel towers, all of American manufacture, the installation and testing having been successfully concluded in May, 1926. H.M. Consul at Caracas reports to the Department of Overseas Trade that the wave-length at present in use is 375 metres; public supply of electricity is relied upon for power, but, in spite of the use of an automatic regulator, trouble is being felt, due to the erratic nature of this power supply. It seems unlikely, however, that local broadcasting will be taken seriously, and consequently purchasers of receiving apparatus will probably still depend essentially on foreign stations for their entertainment.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Asia Minor.—BAGDAD.—June 28th. Direction Générale des Chemins de fer d'Anatolie. One electrically-driven semi-portal crane. (A.X. 3191.)*

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares. (B.X. 2528.)*

August 23rd. 10-in. disk suspension insulators. (B.X. 2614.)*

July 14th. Victorian Government Railways. A.c. power interlocking machine. (B.X. 2596.)*

September 1st Automatic sub-station equipment for Elwood sub-station. (B.X. 2598.)*

August 11th. City Council. H. and l.p., 3-phase sub-station switchgear.*

August 3rd. Postmaster-General's Department. Telephones and dials.*

August 10th. Telephone exchange indicators. (B.X. 2597.)*

BRISBANE.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Belfast.—June 29. Harbour Commissioners. Two electrically-driven main pumps, &c. Specification, &c., from the Harbour Engineer, Harbour Office, Belfast.

Belgium.—June 30. Belgian Post and Telegraph authorities, La Salle Madeleine, Brussels. 240 kilometres of bronze wire in six lots. Particulars (Cahier des Charges Special No. 3-196) for 95 centimes.

Bentley-with-Arksey (near Doncaster). — June 22nd. Urban District Council. Tubing, wiring and electrical fitting of 32 houses and 16 bungalows on Jossey Lane housing site. Mr. P. C. Woodhall, engineer, Council Offices, Bentley.

Brazil.—PORTO ALEGRO.—July 8th. Municipal Council. Electrical material for street lighting. (B.X. 2571.)*

Burnley.—June 26th. Joint Hospital Board. Electric lighting system at the Sanatorium, Marsden Road. (June 4th.)

Dublin.—June 23rd. Great Southern Railways, Ireland. One steam crane and lifting magnet. Forms of tender from the Stores Superintendent, Inchicore, Dublin.

June 24th. County Borough Commissioners. Arc lamp carbons, electric cookers, and h.p. and l.p. circuit breakers. (June 11th.)

June 28th. One steam turbo boiler feed pump, three air filters, two electric vehicles, and steam and water meters. (June 11th.)

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine, direct coupled to an 80-kW generator, complete with switchboard. (B.X. 2537.)*

October 15th. Installation of electric power station equipment at Kench and Luxor. (B.X. 2627.)*

July 10th. Director-General, State Domains Administration (Commercial Service), Savoy House, Qasr el Nil Street, Cairo. Three semi-Diesel engines and two centrifugal pumps.

August 2nd. Director-General, Mechanical Department, P.W.M., Cairo. 400-b.h.p. Diesel engine, driving an air compressor, together with auxiliary machinery.

Glasgow.—June 21st. Education Authority. Installation of electric light at Provanside School. Mr. J. Clark, Director of Education, 129, Bath Street.

Grays.—June 30th. Grays Thurrock Urban District Council. H.p. switchgear, 3,300-V, 3-core cable, and transformers. (See this issue.)

Hamilton.—Lanarkshire County Council. Electric lighting installation at school, Hairmyres Colony. Mr. P. C. Smith, Housing and Town Planning Department, Hamilton.

India.—July 2nd. India Store Department. E.h.p. armour-clad switchgear. (June 11th.)

London.—BERMONDSEY.—July 15th. Borough Council. Electrical installation for lighting, heating, and power at the baths and washhouses, Grange Road. (June 11th.)

Lurgan.—June 21st. Urban District Council. Oil engines and generators, motor-driven pumps, main switchboard, and underground and overhead mains. (June 4th.)

Manchester.—July 7th. Electricity Department. Two 130,000-lb. water-tube boilers, flues, coal chutes, ash hoppers, pipework, valves, induced- and forced-draught plant and chimneys, one 40,000-kW turbo-alternator, with condensing plant, &c. (June 4th.)

July 5th. 33,000-V trunk feeders, pilot cables, and telephone cables. (June 11th.)

New Zealand.—CHRISTCHURCH.—October 19th Christchurch Drainage Board. Three sets of electric centrifugal pumping plant. (A.X. 3215.)*

WELLINGTON.—August 24th. Public Works Department. Synchronous condensers for the Waikaremoana Electric Power Scheme. (B.X. 2608.)*

July 20th. Phase transformer for Mangahao electric power scheme.*

August 30th. 400-V, 3-phase, slip-ring induction motors and starters.*

November 2nd. Electric generators and turbines for Waikaremoana electric power scheme. (B.X. 2622.)*

Normanton.—July 5th. Urban District Council. 1,400 yd. feeder cable. (See this issue.)

Nottingham.—July 6th. Electricity Department. Twelve months' supply of general stores. (See this issue.)

Otley.—June 21st. U.D.C. Electricians' work in connection with the erection of 56 houses, Harefield estate, Farnley Lane. Surveyor to the Urban District Council.

Salford.—June 26th. Electricity Department. Complete workshop equipment for the Agecroft power station. Specifications from the City Electrical Engineer.

South Africa.—July 8th. South African Railways and Harbours. Telegraph material, poles, cross arms, &c. (A.X. 3173.)*

Uruguay.—MONTEVIDEO.—July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B.X. 2523.)*

July 9th. 137,500 metres of rubber-insulated wires and cables. (B.X. 2548.)*

40,000 metres of coloured twin conductor cords. (B.X. 2549.)*

July 22nd. 35,000 electric lamps.*

Wolverhampton.—July 10th. West Midlands Joint Electricity Authority. Two turbo-alternators, condensing plant, &c., for Birchills power station. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—SYDNEY.—City Council.—The Council at its meeting on May 3rd, decided to postpone consideration of the Electricity Committee's recommendation to accept the Australian Commonwealth Shipping Board's tender for mechanical draught plant at £98,833, pending receipt of cable advice from Mr. Forbes Mackay, who is to compare the tenders lodged, &c., and report.—*Tenders.*

The following tenders were accepted :—

Switchgear for Bunnerong power house (£181,356).—Metropolitan-Vickers Electrical Co., Ltd.
Underground cables (section 1).—W. T. Henley's Telegraph Works Co., Ltd. (£4,634); (sections 2, 3, 4, and 5), Enfield Cable Works (Aust.), Ltd. (£19,244).
Fuse boxes and fuses (£10,094).—B. W. Electric Co., Ltd.
H.p. jointing material (£9,762).—Noyes Bros. (Sydney), Ltd.
L.p. d.c. machine panels (£1,300).—Metropolitan-Vickers Electrical Co., Ltd.

NEW SOUTH WALES RAILWAYS. Accepted :—

100 B.T.-H.-type traction motors (£21,996).—Australian General Electric Co., Ltd.

MELBOURNE.—Commonwealth Department of Works and Railways.

Two main passenger electric elevators, Sydney G.P.O. (£9,560).—Standard-Waygood, Ltd.
Electric elevator (kitchen), Sydney G.P.O. (£1,850).—Edmiston & O'Neill Pty., Ltd.

State Electricity Commission of Victoria.

Aluminium cable (£3,943).—British Insulated Cables, Ltd.

—*Tenders.*

Chesterfield.—Electricity Committee. Accepted:—

Cable (£213).—W. T. Glover & Co., Ltd.

Glasgow.—Electricity Committee. Accepted:—

Twelve months' supply of :—

Malleable iron tubes and fittings.—Stewarts & Lloyds, Ltd.
L.p. cables.—Callender's Cable & Construction Co., Ltd.; Enfield Cable Works, Ltd.
H.p. cables.—Callender's Cable & Construction Co., Ltd.; W. T. Glover and Co., Ltd.
I.r. cables and flexibles.—Craigpark Electric Cable Co., Ltd.
Meters.—Chamberlain & Hookham, Ltd.; Edison Swan Electric Co., Ltd.; Elkay Electrical Mfg. Co., Ltd.; Ferranti, Ltd.; Measurement, Ltd.; Metropolitan-Vickers Electrical Co., Ltd.
Arc lamp carbons.—General Electric Co., Ltd.
Cast-iron boxes, section pillars, &c.—Carron Co.; Falkirk Iron Co., Ltd.; M'Dowall, Steven & Co., Ltd.; Robert Taylor.
Cotton waste and dusters.—Easson Bros.; Joseph Findlay & Co.; Porter Bros., Ltd.; Tindal, Hamilton & Co.; Wm. Wiseman & Sons.

Health Committee. Accepted :—

Electric lighting installation at York Street reception house (£87).—Northern Electric Co.

Tramways Committee. Accepted :—

D.c.c. wire.—R. Johnson & Nephew; Siemens Bros. & Co., Ltd.

India.—BOMBAY.—Municipal Corporation. Accepted :—

Electrical installation at students' hostel :—

Marsland, Price & Co., Ltd. (Accepted.)	Rs. **6,490**
Eastern Electric Light and Power Co.	6,889
Holland & Co.	8,593
Crompton & Co., Ltd.	8,792
Sterling Electric Works, Ltd.	8,900
Josts Engineering & Co., Ltd.	8,969
Greaves, Cotton & Co., Ltd.	10,000
Allen Electric Co.	11,016

Lamp Contracts.—Contracts for "Cosmos" electric lamps have been placed with Metro-Vick Supplies, Ltd., by the London, Midland & Scottish Railway Stores Department, the Air Ministry, and the London County Council.

London.—ADMIRALTY.

Lampholders and insulators.—Edison Swan Electric Co., Ltd.

ST. PANCRAS.—Special (Emergency) Committee. Accepted :

7,040 yd. l.p. cable (£904).—Standard Telephones & Cables, Ltd.

ST. MARYLEBONE.—Electricity Supply Committee. Recommended :—

Wiring for electricity the tenements in Ashland House (Ashland Place) and Berkeley Buildings.—London & South Wales Electrical Engineers, Ltd.

SHOREDITCH.—Lighting Committee. Recommended :—

Wiring and fittings for electric lighting, heating and cooking, tenements (30), at Archer House Extension and Arrow House (£683).—Electrical Installations, Ltd.
High-pressure boiler feed mains at the Whiston Street power station (£548).—Babcock & Wilcox, Ltd.

Newport (Mon.).—Electricity Committee. Accepted:—

Overhead line to Llanwern (£696).—Johnson & Phillips, Ltd.

Normanton.—District Council. Accepted:—

Transformers (£215).—Bruce Peebles & Co., Ltd.
Cables (£896).—British Insulated Cable Co.
L.p. switchgear (£400).—Metropolitan-Vickers Electrical Co., Ltd.

Oldham.—Electricity Committee. Accepted:—

A.c. meters.—Measurement, Ltd.
Electric motors.—English Electric Co., Ltd.
Portable conveyor.—C. H. Johnson & Sons, Ltd.
Manhole frames and covers.—John Hall & Sons, Ltd.
Meter boards.—Samuel Ashton, Ltd.

Portsmouth.—Electricity Committee. Recommended:—

Cable (£1,351).—Johnson & Phillips, Ltd.
Circulating pump (£740).—G. & J. Weir.
Steam pump (£350), electric pump (£288).—Mather & Platt, Ltd.

Sunderland.—Corporation. Accepted:—

Replacements to mechanical stokers.—Edward Bennis & Co., Ltd.

Sutton Coldfield.—Electricity Committee. Accepted:—

Switchgear (£178).—G. Ellison.

Wakefield.—West Riding County Council. Accepted:—

Goods lift for New Central Stores.—Medway's Safety Lift Co., Ltd.

Forthcoming Events.

Institution of Heating and Ventilating Engineers.—Monday, June 21st, to Wednesday, June 23rd. At Scarborough. Summer meeting.

Radio Society of Great Britain.—Wednesday, June 23rd. At the Institution of Electrical Engineers, Savoy Place, W.C. At 6 p.m. Ordinary meeting.

Institution of Electrical Engineers.—Jubilee of the Telephone. Thursday, June 24th. At the Hotel Cecil. At 1 p.m. Reception and luncheon.
At 3.30 p.m. At the Institution, Savoy Place. Lecture on the "History and Development of the Telephone," by Sir Oliver Lodge, F.R.S.
Thursday, June 24th. At the Science Museum, South Kensington. At 8.30 p.m. Annual conversazione.

Electrical Contractors' Association Allied Associations.—First Annual Conference. June 23rd, 24th, and 25th. At the Royal Pavilion, Brighton.

Tramways and Light Railways Association.—June 24th and 25th. At Torquay. Annual Conference.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

HERCULITE metal filament lamps.

Notes.

Battery Locomotive Competition.—The Secretary for Mines announces that the report of the judges appointed to adjudicate on the electric storage-battery locomotive competition for a prize of £1,000 offered by Mr. Charles Markham has been published. The object of the competition was to encourage the production of a safe and efficient type of battery locomotive for use underground in coal mines, with a view to obviating the use of pit ponies and increasing coal production. Ten entries were received, five of which were selected by the judges as being suitable for submission to working tests. The winning design was entered by Messrs. Joseph Booth & Bros., Ltd. An outline is given of the technical requirements governing the competition, the tests applied, and a general description of the winning locomotive (see ELECTRICAL REVIEW, October 2nd and 9th, 1925). The report (price 1s. 3d., by post 1s. 4d.) may be purchased through any bookseller, or directly from H.M. Stationery Office.

Threatened Tramway Strike Averted.—The Bury Council decided after the general strike to reduce the holidays of its tramway employés from eight days to four, and as a result the men threatened to refuse to run trams outside the Bury and Radcliffe area after June 19th. The Council replied that unless the men worked unconditionally according to the instructions given by the general manager their services would be dispensed with. The men have withdrawn the strike threat and the situation is to be further considered by the General Purposes Committee.

Batti-Wallahs' Trip to Paris.—The Batti-Wallahs' Society will pay a week-end visit to Paris next month, and will be happy to have the company of ladies and gentlemen introduced by members. In order that suitable hotel arrangements may be made, applications should be sent to the honorary secretary, Mr. M. Whitgift, 7, Coulter Road, Hammersmith, W.6, not later than June 22nd. The party will leave Victoria on Friday, July 24th, at 2 p.m., arriving in Paris at 8.15 p.m. It will leave Paris on the return journey on Monday at 4 p.m., arriving at Victoria at 10.15 p.m. (First-class rail, accommodation at Hotel de Louvre (or Louvois), including all meals, motor rides round Paris, to Versailles or Fontainbleau, motor on Sunday to Auteuil Races for the Grand Prix, transport of baggage, &c., £9 10s.)

Late Legal.—MARCONI VALVE PATENT.—In the Chancery Division, on Tuesday, Mr. Justice Tomlin made an order by consent granting an injunction to the Marconi Wireless Telegraph Co., Ltd., restraining Brahams (Houndsditch), Ltd., from infringing their letters patent No. 184,446 for wireless valves. Mr. Trevor Watson, for the plaintiff, said it had been agreed that defendants should pay £50 as damages and 15 guineas as fees to the plaintiff's representatives for the examination of the infringing articles.

RADIO PHONOPORE AND ELECTRICALS, LTD.—Mr. Justice Romer, in the Companies Winding-up Court, on Tuesday, made an order for the compulsory liquidation of this company, on the petition of Mr. C. W. Slingo, of 39, Loveday Road, West Ealing. Counsel for the petitioner said the petition stood over for arrangements to be made. While admitting that negotiations had not entirely broken down, it was obvious that a winding-up order could not be avoided, and he asked for the usual order.

NELSON ELECTRIC CO., LTD.—Mr. Justice Romer, in the Companies' Winding-up Court, on Tuesday, adjourned for a week the petition of Mr. Eugene Durand for an order for the compulsory liquidation of this company. Counsel for the company said the petitioner's debt had been paid, and that arrangements had been made to pay other creditors for sums amounting to £2,369 within a few days.

W. E. Highfield Shield Competition.—The deferred meeting of the London members of the National Association of Supervising Electricians was held on June 10th to decide on the winning papers in the fourth annual competition for the above shield and additional prizes. For the members' section the shield and the first prize, value £3 3s., presented by Messrs. W. T. Henley's Telegraph Works Co., Ltd., were awarded to Mr. R. K. Haslett, Belfast, for "27 Years Experience of Electrical Installation Work." The second prize, value £2 2s., presented by Messrs. Burdette & Co., Ltd., was awarded to Mr. W. J. Revell, London, for "Practical Hints on Estimating." The third prize, value £1 1s., by Millns Electrical Co., to Mr. J. Southern, London, for "Ups and Downs of Electrical Contracting." The first prize of the associates' section, value £2 2s., presented by Power Contracts, Ltd., was awarded to Mr. T. V. Harding, London, for "Marine Practice To-day," and the second prize, value £1 1s., by the Editor of *Electricity*, to Mr. H. J. Kimber, London, for "Organisation and its Relation to Progress."

Breakdown at Manchester.—It is reported that a fault on one of the 33,000-V cables connecting the Barton generating station with the city resulted in an almost complete failure of the supply to the city on June 13th.

Indian Railway Electrification.—An important contract received by the Metropolitan-Vickers Electrical Co., Ltd., from India comprises 41 electric freight locomotives for the electrification of the Great Indian Peninsula Railway main line from Bombay to Igatpuri and to Poona, both branches passing over the Ghats, where gradients of 1 in 40 and 1 in 38 are regularly encountered; the gauge of the line is 5 ft. 6 in. The locomotives will be of the side-rod type, with motors mounted above the deck, and consist of two trucks, each with three axles, coupled together with an articulating joint, a single body being mounted on the pair of trucks. Each truck will have a twin motor of 1,300 h.p. rigidly mounted on it and driving a jack shaft through single reduction gearing, with gears on each side of the motor. Pinions of the flexible spring type will be used in order to transmit the power resiliently to the jack shaft, which will transmit its power to the rear axle of the truck through long connecting rods, and to the other two axles from the rear axle by means of coupling rods. Each truck will have the same electrical equipment, the total horse-power of the locomotive being 2,600 h.p. on the one-hour rating. The motors will be provided with forced draught so as to enable a high continuous rating to be obtained. The centre of gravity of the locomotive will be comparatively high, with the main running axle boxes inside the wheels, which will give a very good combination for smooth running. The locomotive speed will generally be about 20 miles per hour on the gradient, with a maximum speed of 45 miles per hour. Regenerative braking is to be provided to enable heavy trains to be safely handled on the hilly section of the line.

Proposed Electrical Congress in Moscow.—The Trade Commissariat has authorised the State Planning Commission and the Supreme Economic Council to call a Pan-Union Electrotechnical Congress in Moscow towards the end of the year.—*Reuter's Trade Service* (Moscow).

Drying-Out Plant for Transformers.—In Bulletin No. 56/57, just issued by Messrs. Oerlikon, Ltd., London, there appears a description of a new drying-out installation recently put into service at the Oerlikon Works in Switzerland, which presents several interesting features. It consists of a tank capable of accommodating the largest transformers, in which the air is exhausted during the drying-out process by means of a vacuum pump. Heating is effected either by steam pipes arranged in the tank, or by an external heater through which the oil of the transformers is forced by a circulating pump. The tank has a diameter of about 16 ft. and a total height of about 22 ft. The tank has a circular section, both bottom and cover being dished; the cover is fitted with a vacuum gauge and a thermometer. Provision has been made for glass inspection windows and electric lighting in the tank, so that the upper surface of oil in the transformer tank can be easily examined during the drying-out process. The cover of the tank is hinged and can be raised by means of a motor-driven winch; the tank is nearly completely sunk in the floor.

The use of steam heating by means of the pipe system is mainly confined to cases where a number of small transformers are being dried out at the same time. When, however, large transformers with a great heat capacity have to be dealt with, this mode of heating is too slow, owing to the low thermal conductivity in the tank, due to the rarefaction of the air. The transformers are then dried out by causing the oil to circulate through the oil heater, which is of standard Oerlikon design and has a capacity of 100 kW. Owing to the fact that the oil is heated indirectly in this plant and does not come into contact with the electric heating coils, there is no danger of the oil being overheated at any point. The oil heater is fitted with safety devices which cut off the heating current when the temperature of the oil rises too high, or interrupts the oil circulation. Arrangements have been made to permit of heating the oil directly by means of electrical resistances, should it be desired, air-tight bushings being provided for leading in the conductors.

As the drying-out process is carried out with a high vacuum in the tank, the circulating pump for the oil heater cannot operate as a suction pump, but has to be used as a compression pump; consequently, it has been necessary to mount it at the bottom of the tank. The oil heater, however, is installed above on the floor level, at the side of the tank. The circulating pump consists of a centrifugal pump built as an integral part of the driving motor; the pump has no glands and no external moving parts; it requires no attention, works practically noiselessly, and is very reliable in operation. The vacuum pump for exhausting the air in the tank is also of the Oerlikon Co.'s manufacture.

Fatalities.—At an inquest at Boosbeck, Redcar, recently on Henry Nellist, 16, it was stated that while in some outbuildings he took hold of about three inches of non-insulated wire attached to an electric lighting ceiling fitting and received a fatal shock. A verdict of "Accidental death" was returned.

An inquiry was held recently into the death of J. E. Redwood (36), who was killed by falling a distance of 70 ft. whilst working at the Grove Road generating station, St. Marylebone. Deceased was engaged in shifting tackle. A verdict of "Accidental death" was recorded.

As the result of burns received from a fire at the Osborne Street, Manchester, generating station on June 10th, John Ryan (36) died in the Jewish Hospital on the same day.

Fulham Strike Episode.—It is reported that the Fulham Electricity Committee has recommended that the six men who were concerned in the recent strike episode at the Fulham electricity works be taken back as vacancies arise, at the discretion of the engineer, on the strict understanding that a repetition of such action will be visited with instant dismissal without any hope of reinstatement.

Awards to Inventors' Report.—The fourth report of the Royal Commission on Awards to Inventors has been published as a Parliamentary Paper (Cmd. 2,656, H.M. Stationery Office, price 2d. net). It relates to the proceedings of the Commission from August 1st, 1924, to December 31st, 1925. The Commission sat on 46 days and dealt with 39 cases; the Investigating Committee dealt with 60 claims and heard 14 of the claimants in person. Particulars of the claims actually heard are given in appendices of the report. Awards varying from £200 to £2,500 were granted in respect of several wireless apparatus inventions.

Cooper's Hill War Memorial Prize.—The triennial award of the above prize which fell to the Council of the Institution of Electrical Engineers last year is still at their disposal, no papers having been submitted. The Council have selected the following seven subjects, and members are invited to submit for consideration not later than October 31st a paper on any one of them:—

"The Use of Electricity in Public Works."
"Hydro-Electric Power in Rural Districts."
"Electrification of Railways."
"Electricity in Agriculture."
"Electric Railways in the Empire Overseas."
"Hydro-Electric Resources in the Empire Overseas."
"The Line and Wireless Communication of India."

Only corporate members of the Institution who were under 30 years of age on January 1st, 1926, are eligible for the prize, which consists of: (1) A bronze medal; (2) a parchment certificate of award; (3) a money prize of the value of about £25.

Appointments Vacant.—Shift engineer for the Eccles Corporation electricity works. Shift engineer for the Hong-Kong Electric Co., Ltd. District engineer for the Electricity Distribution of North Wales and District, Ltd. General manager and engineer for the Rhondda Tramways Co., Ltd. Electrical engineers for the Public Works Department, Government of Burma. Meter room assistant for the Stepney Borough Council Electricity Department. (See our advertisement pages to-day.)

Hospital Equipment.—In the new buildings of University College Hospital, London, having a total content of about 4,000,000 cubic feet, new boiler plant has been installed for the heating of the whole of the hospital buildings. From a central control room the heating, hot-water and steam services throughout the buildings are regulated, with the aid of electrical distant thermometers in all the wards, &c. The four kitchens are all equipped with apparatus for cooking by steam, gas, and electricity, automatic electric lifts, and electric ventilating fans, and washing-up is done with electrically-driven steam-heated washers, which enables one maid in half-an-hour to do work which formerly occupied several women for the whole afternoon. Refrigerating plant is also installed. All the sterilisers can be operated by either steam or electricity. The whole of the engineering work was designed by Mr. A. H. Barker, M.Inst.C.E., consulting engineer to the hospital.

Large Italian Transformers.—The Società Industriale San Giorgi, of Turin, is at present constructing three oil transformers with external water cooling, for the Terni steelworks, which are notable from the point of view of their size. Each of the transformers, which will weigh about 134 tons, will have a continuous capacity of 43,000 kVA, and is intended to deal with 10,100/143,300-V 45-period energy.

Association of Consulting Engineers.—The 12th annual general meeting of the Association of Consulting Engineers (Inc.) was held on May 27th, when the report of the committee for the 12 months ended April 30th, 1926, was presented. The membership of the Association at the end of the period under review was 110. The income for the year was £467, being £51 in excess of the expenditure.

Institution Notes.

Institution of Electrical Engineers.—JUBILEE OF THE TELEPHONE.—The fiftieth anniversary of the telephone will be celebrated by the Institution on June 24th, 1926, and in that connection the President and Council are giving a luncheon at the Hotel Cecil on that day. A meeting is also to be held at 3.15 on the same afternoon in the lecture theatre, when the Faraday Medal of the Institution will be presented to Colonel R. E. B. Crompton, C.B., honorary member and past-president. The presentation will be followed by a lecture by Sir Oliver Lodge, D.Sc., F.R.S., on "The History and Development of the Telephone." The Institution conversazione will take place in the evening.

Institution of Public Lighting Engineers.—CONFERENCE.—The annual conference of the Institution is to be held at Newcastle from September 14th to 16th next, and municipalities throughout the country are being invited to be represented. Mr. H. Dickinson, City Electrical Engineer of Liverpool, will read a paper at the conference on "Some Aspects of Electric Street Lighting in Liverpool." We are informed that Mr. Alexander C. Cramb, M.I.E.E., engineer and manager of the Electricity Department, Croydon, has accepted the invitation of the Council of the Institution to take the office of vice-president so as to become president of the Institution in 1927, when the annual conference will take place at Brighton.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

The *Birmingham Post* states that the Wolverhampton Electricity Committee has accepted the resignation of the borough electrical engineer, Mr. S. T. ALLEN, following his appointment as engineer and manager of the West Midlands Joint Electricity Authority. The Committee recommended the appointment of the present assistant engineer, Mr. E. MORGAN, as his successor, but when the matter was discussed by the General Purposes Committee there was a sharp division of opinion, and the General Purposes Committee passed a resolution that the post should be advertised. The salary proposed was £1,000 per annum, with two annual increments of £125 per annum, and it was not proposed to appoint a successor to Mr. Morgan. The Electricity Committee pointed out that the generating station would be transferred to the West Midlands Joint Authority probably at the end of the current financial year, and it was considered advisable to have an engineer familiar with the undertaking. The matter came before the Town Council on June 14th, when it was decided to appoint Mr. Morgan to the position at a salary of £1,000, without the proposed annual increments.

Mr. EDGAR SHUTT, who has retired after 19 years' continuous service in the meter department of the Blackpool Corporation Electricity Department, was recently presented with an easy chair by the staff. Mr. C. Furness, chief engineer, made the presentation.

At the annual meeting of the Ayrshire Electricity Board, ex-Provost MATTHEW SMITH, O.B.E., Kilmarnock, was unanimously reappointed chairman of the Board. Police-Judge SMITH, Ayr, and ex-Bailie DAVID JONES, Kilmarnock, were unanimously re-elected conveners of the Finance and Engineering Committees respectively.

Mr. A. J. HOWARD, borough electrical engineer, Taunton, left Southampton on Saturday last on the *Berengaria* for a health and pleasure trip, at his own expense, to U.S.A. and Canada, where he will have an opportunity of studying electrical developments.

Mr. P. G. RUDD has resigned his position as sales manager with the Solidite Manufacturing Co., Ltd. His private address is 13, Courtley Avenue, Clapham Common, S.W.

Mr. H. G. WRIGHT, A.M.I.E.E., engineer and manager, The Cleveland Trust, Ltd., Electricity Works, Saltburn-by-the-Sea, has been appointed electrical engineer to the Aldershot Gas, Water and District Lighting Co., and will take up his duties on June 24th.

Mr. W. D. DAWES, London manager and secretary of the Anglo-Argentine Tramways Co., Ltd., has been appointed managing director of the company, and the assistant secretary, Mr. J. S. ANDERSON, has been appointed secretary.

Mr. J. T. GREEN, who has been with the Liverpool Electric Cable Co., Ltd., since its formation in 1901, as chief clerk, assistant secretary and branch manager, has relinquished his connection with the company. His address is 51, Devonfield Road, Orrell Park, Liverpool.

Mr. C. W. PEARCE, late works manager of the Dynamo and Motor Repairs, Ltd., has been appointed works manager of Manda Motors, Ltd.

Obituary.—LORD STEVENSON.—We regret to record the death of Lord Stevenson at the early age of 53 years. As Mr. James Stevenson he rendered important organising service to the Ministry of Munitions during the war; in 1921 he was appointed to the Committee which subsequently became responsible for the Stevenson rubber restriction scheme; and when the British Empire Exhibition was in process of organisation he was appointed chairman of the Standing Committee.

MR. H. HOLLIDAY.—We regret to learn of the death, which took place on June 12th, of Mr. Harry Holliday, manager of the Rhondda Tramway Co. He was 40 years of age, and was the eldest son of the late Mr. T. B. Holliday, a former manager of the tramways at Hastings.

New Companies Registered.

Record Corporation, Ltd. (213,766).—Private company. Registered May 13th. Capital, £35,000 in 25,000 preference shares of £1 each and 20,000 ordinary shares of 10s. each. To acquire the business of engineers and manufacturers of "Record Silent" engines for industrial, electric lighting, marine and other purposes, and all or any of the assets of that business, including the British and foreign patents and patent rights now belonging to W. O. Larmuth in connection therewith. The subscribers (each with one preference share) are:—H. F. Heal, 57, South Oak Street, Burton-on-Trent, secretary; C. F. Rossiter, The Elms Cottage, Sutbury, Burton-on-Trent, works manager. The first directors are to be appointed by the subscribers. Qualification, £100 shares or stock. Remuneration as fixed by the company. Secretary: H. F. Heal. Solicitors: Addleshaw, Sons & Latham, 15, Norfolk Street, Manchester.

Traders Magneto and Dynamo Co., Ltd. (7,485).—Private company. Registered in Dublin on May 4th. Capital, £1,000 in £1 shares. Objects: To carry on the business indicated by the title and that of manufacturers and hirers of and dealers in motor-cars, motor cycles, cycle cars, cycles, &c. The directors are:—A. J. Doyle, 74, Hannaville Park, Terenure, Dublin, motor factor and engineer; Mrs. C. C. Callaghan, Ferndene, Stradbrook, Blackrock, Co. Dublin; M. B. Doyle, 74, Hannaville Park, Dublin.

American Radio Corporation, Ltd. (214,190).—Private company. Registered June 7th. Capital, £500 in 495 6 per cent. cumulative preference shares of £1 each and 100 ordinary shares of 1s. each. Objects: To carry on the business of manufacturers of and dealers in wireless accessories of all kinds, &c. The permanent directors are:—F. N. Coni, 71, Amesbury Avenue, Streatham Hill, S.W.16; L. C. Curd, 11, Springfield Gardens, Upper Clapton, E.5; F. Parlett, 26, Queen's Gardens, W.2. Remuneration as fixed by the company. Secretary: L. C. Curd. Solicitors: Pollock, Booth and Addis, Milton House, 35, Surrey Street, W.C. Registered office: 18, Conduit Street, W.1.

Grosvenor Battery Co., Ltd. (214,180).—Private company. Registered June 5th. Capital, £5,000 in £1 shares. Objects: To carry on the business of manufacturers, importers and repairers of, agents for and dealers in electrical goods, equipment and accessories of all kinds, fittings, switchboards, recorders, indicators, bells, clocks, time switches and batteries; manufacturers of, agents for and dealers in instruments and accessories used in connection with radio-telegraphy, &c. The subscribers (each with one share) are:—W. G. Adie, Fels Farm, Eastbrook End, near Romford, Essex, merchant; M. G. Chant, 70a, Basinghall Street, E.C.2, C.A. Directors: F. Goodchild and W. G. Adie. Remuneration, £50 each per annum.

Berk and Dundas Fox, Ltd. (214,258).—Private company. Registered June 10th. Capital, £2,000 in £1 shares (1,800 5 per cent. preference and 200 ordinary). Objects: To carry on the business of electricians, mechanical and wireless engineers, manufacturers of and dealers in all apparatus for use in connection with the generation, distribution, supply and employment of electricity and radio power, small hardware merchants, fancy goods merchants, gold and silver smiths, watch and clock makers, manufacturers and repairers of and dealers in motor cars, &c. The first directors are:—A. Berk, 28, Hanover Square, Bradford; W. Dundas Fox, 25, Blenheim Road, Bradford (both permanent, subject to each holding 10 ordinary shares). Qualification of ordinary directors, 10 preference or ordinary shares. Remuneration as fixed by the company. Solicitor: D. G. Ineson, 1, Northgate, Cleckheaton. Registered office: 86a, Manningham Lane, Bradford.

Electric Brush Co., Ltd. (214,195).—Private company. Registered June 7th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of and wholesale and retail dealers in electrical brushes, appliances and implements, mechanical and electrical apparatus and articles required for use in connection with the toilet or massage, or for the stable or for recreation or amusement, &c. The subscribers (each with one share) are:—S. Cronin, 31-4, Basinghall Street, E.C.2, solicitor's clerk; F. Cockayne, 31-4, Basinghall Street, E.C.2, solicitor's clerk. The first directors are to be appointed by the subscribers. No share qualification required. Solicitors: McKenna & Co., 31-4, Basinghall Street, E.C.

Official Returns of Electrical Companies.

Thames Electric Wireless Co., Ltd.—H. C. Mundy, of 93 and 94, Chancery Lane, W.C.2, was appointed receiver and manager on May 3rd, 1926, under powers contained in first mortgage debentures dated July 4th, 1923.

Gil-Ray Trading Corporation, Ltd.—Debenture dated May 20th, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: G. A. Anderson, 11, River Street, Rhyl, North Wales.

Erith Electrical Co., Ltd.—R. B. Tyler, C.A., of 1, Queen Victoria Street, E.C.4, ceased to act as receiver or manager on May 18th, 1926.

West London and Provincial Electric Supply Co., Ltd. (62,097).—Capital, £150,000 in 70,000 ordinary and 80,000 preference shares of £1 each. Return dated April 7th, 1926. 23,354 ordinary and 49,077 preference shares taken up. £57,431 paid on 15,854 ordinary and 41,577 preference shares. £15,000 considered as paid on 7,500 ordinary and 7,500 preference. Mortgages and charges, nil.

Wycombe Borough Electric Light and Power Co., Ltd. (53,133).—Capital, £125,000 in 20,000 ordinary and 5,000 preference shares of £5 each. Return dated April 27th, 1926. 15,000 ordinary and 3,000 preference shares taken up. £90,000 paid. Mortgages and charges, £40,000.

Brompton and Kensington Electricity Supply Co., Ltd. (25,913C).—Capital, £300,000 in £1 shares. Return dated April 1st, 1926. All shares taken up. £199,845 paid. £100,155 considered as paid. Mortgages and charges, nil.

Erskine, Heap & Co., Ltd. (126,262).—Capital, £50,000 in £1 shares. Return dated April 1st, 1926. 45,489 shares taken up. £7,826 paid. £37,663 considered as paid. Mortgages and charges, nil.

Cambridge Electric Supply Co., Ltd. (36,457).—Capital, £100,000 in £10 shares. Return dated March 31st, 1926. All shares taken up. £100,000 paid. Mortgages and charges, £75,000.

Charing Cross Electricity Supply Co., Ltd. (29,122).—Capital, £2,250,000 in 400,000 preference, 900,000 ordinary, 400,000 City Undertaking preference, and 550,000 City Undertaking ordinary shares of £1 each. Return dated March 18th, 1926. 400,000 preference, 576,000 ordinary, 400,000 City Undertaking preference, and 550,000 City Undertaking ordinary shares taken up. £1,280,000 paid. £646,000 considered as paid. Mortgages and charges, £1,336,178.

Cecil Hodges & Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated May 20th, 1926, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Allen, West & Co., Ltd. (108,870).—Capital, £150,000 in £1 shares. Return dated December 31st, 1925. 141,724 shares taken up. £141,724 paid. Mortgages and charges, £60,000.

Douglas Southern Electric Tramways, Ltd. (45,701).—Capital, £50,000 in 30,000 preference and 20,000 ordinary shares of £1 each. Return dated December 24th, 1925. 25,973 preference and 15,472 ordinary shares taken up. £18,370 paid on 12,566 preference and 5,804 ordinary. £23,075 considered as paid on 13,407 preference and 9,668 ordinary. Mortgages and charges, £1,376.

Smithfield Markets Electric Supply Co., Ltd. (53,354).—Capital, £100,000 in 60,000 shares of £1 each and 8,000 shares of £5. Return dated March 11th, 1926. 60,000 £1 shares taken up. £60,000 paid. Mortgages and charges, £16,170.

Northallerton Electric Light and Power Co., Ltd. (59,301).—Capital, £6,500 in 2,900 preference shares of £1 each and 12,000 ordinary shares of 6s. each. Return dated March 10th, 1926. 1,161 preference and 7,829 ordinary shares taken up. £3,509 paid. Mortgages and charges, £3,900.

British Columbia Electric Railway Co., Ltd. (51,953).—Capital, £5,000,000 in £1,440,000 5 per cent. cumulative perpetual preference stock, £1,440,000 preferred ordinary stock, £1,440,000 deferred ordinary stock, and £680,000 shares of £1 each (unissued). Return dated January 6th, 1926. £4,320,000 stock taken up. £4,120,000 paid on £1,440,000 5 per cent. cumulative preferred preference, £1,440,000 on preferred ordinary stock, and £1,240,000 on the deferred ordinary stock. £1 15s. paid up on 7 forfeited shares. £200,000 considered as paid on £200,000 deferred ordinary stock. Mortgages and charges, £3,851,870.

W. E. Dove & Co., Ltd.—Capital, £3,500 in £10 shares. Return dated March 8th, 1926. 320 shares taken up. £2,000 paid. £1,200 considered as paid. Mortgages and charges, £800.

Gosport and Alverstoke Electric Lighting Co., Ltd. (82,693).—Capital, £35,000 in £10 shares. Return dated July 8th, 1925 (filed April 7th, 1926). 2,500 shares taken up. £25,000 paid. Mortgages and charges, nil.

Lymington Electric Light and Power Co., Ltd. (57,985).—Capital, £30,000 in 4,600 ordinary and 1,400 preference shares of £5 each. Return dated April 21st, 1926. 4,600 ordinary and 1,285 preference shares taken up. £29,425 paid. Mortgages and charges, £9,600.

Camborne Electricity Supply Co., Ltd. (57,950).—Capital, £10,000 in £1 shares. Return dated May 13th, 1926. 605 shares taken up. £605 paid. Mortgages and charges, nil.

Win-Sum Electric Diffusers, Ltd.—G. A. Siday, of Plant House, Ealing, W.5, was appointed receiver and manager on June 1st, under powers contained in debentures dated February 2nd, 1926.

H. L. Wood & Son, Ltd.—T. Delaney, of 88, Fleet Street, E.C., was appointed receiver on May 31st, 1926, under powers contained in debentures dated November 17th, 1925.

Rhayader Electric Light and Power Co., Ltd.—Mortgage by demise dated May 29th, 1926, to secure £300 charged on certain property at Rhayader, rights and easements, &c. Holder: A. G. Richardson, Bryncoed, Rhayader.

F. Geere Howard, Ltd.—Satisfaction in full on May 31st, 1926, of debentures dated August 10th, 1922, securing £6,250.

County of Durham Electrical Power Distribution Co., Ltd. (61,591).—Capital, £535,000 in £1 shares. Return dated March 31st, 1926. All shares taken up. £535,000 paid. Mortgages and charges, £250,000.

British Insulated Cables, Ltd. (52,285). — Capital, £2,000,000 in 1,333,333 ordinary, 500,000 preference, and 166,667 unissued shares of £1 each. Return dated April 5th, 1926. 1,333,333 ordinary and 500,000 preference shares taken up. £1,406,008 paid on 1,033,658 ordinary and 372,350 preference shares. £427,325 considered as paid on 299,675 ordinary and 127,650 preference shares. Mortgages and charges, £700,000.

British Insulated Cables (S.A.), Ltd. (formerly Telegraph Manufacturing Co. (Colonial). Ltd.). (71,854).—Capital, £2,000 in £1 shares. Return dated March 24th, 1926. All shares taken up. £2,000 paid. Mortgages and charges, nil.

Electro-Metals, Ltd. (110,432).—Capital, £30,000 in 4,000 preference shares of £5 each and 10,000 ordinary shares of £1 each. Return dated December 28th, 1925. 102 preference and 10,000 ordinary shares taken up. £510 paid on the preference shares. £10,000 considered as paid on the ordinary shares. Mortgages and charges, nil.

Whitchurch and Pangbourne Electric Supply Co., Ltd. (75,400).—Capital, £10,000 in 1,700 ordinary and 300 preference shares of £5 each. Return dated May 19th, 1926. 1,700 ordinary shares taken up. £8,500 paid. Mortgages and charges, nil.

Wellingborough Electric Supply Co., Ltd. (65,747).—Capital, £50,000 in £10 shares. Return dated March 11th, 1926. 4,500 shares taken up. £45,000 paid. Mortgages and charges, £17,500.

Ericsson Telephones, Ltd. (formerly the British L.M. Ericsson Manufacturing Co., Ltd.) (79,061).—Return dated April 13th, 1926. Capital at date of return, £200,000 in 99,990 preference and 100,010 ordinary shares of £1 each (increased April 14th, 1926, to £500,000 in 199,970 preference and 300,030 ordinary shares of £1 each). 99,990 preference and 100,010 ordinary shares taken up. £170,000 paid (being £1 per share on 50,010 ordinary and 99,990 preference and 8s. per share on 50,000 ordinary shares). £30 000 considered as paid (being 12s. per share on 50,000 ordinary shares). Mortgages and charges, £100,000.

Gent & Co., Ltd. (78,797).—Capital, £50,000 in 20,000 preference and 30,000 ordinary shares of £1 each. Return dated March 9th, 1926. 4,427 preference and 20,876 ordinary shares taken up. £6,887 paid on 957 preference and 5,930 ordinary shares. £18,416 considered as paid on the remainder. Mortgages and charges, £16,500.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

British Electric Traction Co., Ltd.

The annual meeting was held on June 11th, Mr. J. S. Austen (chairman) presiding. The chairman briefly reviewed the working of the past year. It would be seen, he pointed out, that the Company had earned £14,000 more than in the previous year, and was able to recommend the payment of 8 per cent. on the ordinary stock, against 7 per cent. That was the fourth consecutive year in which they had been able to raise the dividend by one per cent. Early last year they became anxious because they were not going to receive a dividend upon their holding in the Scottish General Transport Co., whereas they had received over £11,000 in the previous year. That loss had been made good. After the payment of the ordinary dividend they were able to add about £22,500 to their undivided profits account, making that account practically £300,000. There were many stockholders who would like to see those undivided profits represented by a certificate, in other words, they would like to have a stock bonus. Theoretically, there was no benefit to the stockholders in the stock bonus, because the dividend paid on it would otherwise have been distributed as an extra dividend on the ordinary stock, and in practice there were many difficulties attached to a stock bonus. They had to be careful that they did not infringe the rights of the holders of the preferred stocks. The rights of the latter were that, in the first place they were entitled to a dividend of 6 per cent., following which the ordinary stock received 8 per cent., and then they shared equally until the preferred had received 8 per cent., after which they had no further participation. So that if they were to make a distribution of ordinary stock, they would, in fact, be paying a certain amount in front of the preferred stock. He thought, however, that he could put before them a scheme that would obviate that difficulty. Stating the terms in round figures, supposing they found themselves in the position to distribute an extra £20,000. Of that sum, £7,000 would belong to the preferred stockholders, and £13,000 to the deferred stockholders. It was obvious that it would make no difference to the preferred holders, so long as they got their £7,000, what happened to the £13,000. So that if they were to create a deferred stock it would not matter to the preferred whether that £13,000 went to the ordinary stock or to the new deferred ordinary stock. In other words, the scheme would be to turn the ordinary stock into an 8 per cent. ordinary stock, or to limit the dividend on the ordinary stock to 8 per cent., and then to give to the ordinary stock some deferred stock which would receive all over the 8 per cent. the ordinary was now entitled to receive. That was the scheme the directors had in their minds, and that being the case, it was only right the shareholders should know it. If they wished to know when the scheme was likely to materialise, the answer was as soon as they found themselves in the position to make extra distribution upon the preferred stock. Owing to the uncertainty of the effects of the general strike and the coal stoppage he could not say more. He expressed the hope that if they were not able to do it this time next year, they would at least then be in the position to indicate a fairly close date when it would take place. Mr. Baldwin asked what there was to prevent a cash distribution instead of a distribution of stock. The company was interested in the Underground Group in investment in the London & Suburban & Associated Construction Companies, which had in the past year shown but poor results, and he thought some scheme might be put forward whereby in the event of any amalgamation scheme and a reconstruction of the capital of the Underground Railway Companies, they could come in as shareholders in a common fund stock. The chairman, in reply, said as far as he could say, there would be no legal objection to the distribution mentioned by the last speaker, except that it had not been considered advisable in the past to divide the profits right up to the hilt, which policy still continued. If they did such a thing they would have to reduce their dividend on the ordinary stock and he could not see that any benefit would arise from such action. As regarded the possible Underground amalgamation, that was far too big a question to be dealt with that day. There was already in existence a scheme by which receipts were pooled, but the procession of evolution must be, necessarily, slow and could not be hurried. He looked forward to the day when the whole of the means of traction in London would be in the one hand. The report and accounts were adopted.

Electric Construction Co., Ltd.

The annual general meeting was held on June 10th, Mr. P. E. Beachcroft (chairman) presiding. In presenting the report and accounts (ELECTRICAL REVIEW, June 11th, p. 882) the chairman expressed the board's regret at the death of Sir Henry Mance, who had been connected with the company for over 33 years. Mr. W. M. Furniss, the manager of the works at Wolverhampton, had been appointed to fill the vacancy on the board. Although the crisis through which the country had recently passed did not actually occur within the year under review, the preceding unrest seriously affected operations in almost every industry, with the result that the general conditions of trading were rendered extremely difficult, and although inquiries for new machinery and equipment were numerous, the placing of orders was greatly retarded. They were therefore justified in congratulating themselves on being able to present a satisfactory report. The general strike did not directly affect the company to any extent, as the workpeople were not called out until two days before the strike ended, and a very small percentage only suspended operations then. There was undoubtedly a solid foundation for belief that, if further labour troubles did not intervene, a long period of prosperity lay before the electrical industry. In whatever form the Electricity Bill now before Parliament became law, it could not fail to create a very large demand for electrical plant and apparatus for the stations to be erected and for new consumers. Moreover, the interconnection of those large stations, involving the standardisation of the frequency of supply, would render obsolete a great deal of existing electrical machinery.

Thus the outlook for manufacturers was exceedingly good, but it might be a year or two before any benefit was derived from the new legislation. The chairman then reviewed the accounts, and said that during the past financial year they had purchased and cancelled £3,700 of debenture stock, the discount, amounting to £921, having been added to the general reserve fund, which now amounted to £165,921. That fund, together with the dividend equalisation fund and the undivided profits, amounting to the sum of £217,458, being invested entirely in gilt-edged securities, the financial position of the company left nothing to be desired. With regard to the immediate outlook he was pleased to say that since the beginning of the new financial year the orders had exceeded those of the corresponding period of last year. As, however, extensions to central stations were, to a large extent, suspended until the Electricity Bill had been passed, and as there were still no indications of the mining dispute or the general depression in trade coming to an end, it was impossible to speak with any assurance as to the future, but he had no doubt that they would continue to secure their fair share of what business was going. They had just completed negotiations for the acquisition of the goodwill of Sandycroft, Ltd., relating to the manufacture of electrical machinery and switchgear, with the exception of certain specialities. The acquisition included the sole manufacturing rights of the well-known cascade machines and one-half share of the patents taken out by Sandycrofts jointly with the inventor—Mr. L. J. Hunt—who was to act in an advisory capacity for the company solely, for a period of three years. They were confident that those arrangements would add considerably to their turnover as soon as the machinery and tools, &c., purchased from Sandycroft, Ltd., had been transferred to their own works at Wolverhampton.

Eastern Telegraph Co., Ltd.

Sir John Denison-Pender, G.B.E., presiding at the annual meeting on June 8th, said that the agreements with the Eastern and South African, the Europe and Azores, and the West African Telegraph Companies came into force on January 1st, 1925, and as a result there had been a considerable augmentation in both the revenue and the expenditure which made comparison with 1924 impossible. The financial result was satisfactory having regard to the depressed state of trade; the increased available balance was chiefly due to a reduction of £81,000 in respect of taxation and the interest on the loan from the Eastern and South African Co. The dividend had been maintained at 10 per cent. free of tax, while the contribution to reserve and the balance carried forward had been increased. The reserves were being rearranged; the sum of £860,000 appearing as " Provision on account of investment fluctuations " was in excess of the amount required, but it was proposed to leave it undisturbed to meet any possible future contingencies. Referring to the pensions provisions, the chairman said that it was the practice of the board to supplement retiring allowances in consonance with the increased cost of living. The International Telegraph Conference in Paris last year discussed many matters, the principal one being the question of increasing the charges for code language. The Eastern Companies' representatives declared themselves against any disturbance of existing conditions; a committee was appointed to go into the matter and report to the next International Conference. The companies' delegates also opposed any increase in charges. The chairman said that although Government administrations had sanctioned increases the company's tariffs remained at the pre-war level. The position in Greece and Turkey remain practically unaltered. The change of Government in Turkey had delayed negotiations, while the revenue from the Greek traffic still gave the company a very small return. If the company could not secure an adequate margin of profit it would be obliged to close down in Greece and dismiss its Greek staff, numbering nearly 500. After lengthy negotiations with the French Administration, it was hoped that a special wire between London and Paris would shortly be leased to the company, with permission to deal direct with the public in Paris. New offices had accordingly been secured in that city. Two recent improvements were mentioned by the chairman, *viz.*, the use of " loaded " cables and the invention of a " regenerator " by the company's staff. That apparatus overcame the disabilities inherent in the old system of relaying from one cable to another which only permitted reduced speeds owing to distortion. The regenerator increased the speed of transmission by over 35 per cent. and a further gain was secured by a reduction of stoppages, making an overall improvement of 48 per cent. A considerable speeding-up had been effected during the past year or two. In conclusion, the chairman mentioned the retirement from the board of Sir Robert Kindersley and the appointment of Mr. H. C. Hambro in his place.

United River Plate Telephone Co., Ltd.

The annual meeting was held on June 8th under the chairmanship of Mr. Percy Cross. In moving the adoption of the report and accounts (*vide* our last issue, p. 882), Mr. Cross said that the results of the past year's working were very good. During the year issues of new capital amounting in the aggregate to £1,320,000, had been made; the position and prestige of the company had enabled it to raise the money without difficulty. The capital expenditure had very nearly reached the million-pound mark forecast last year. The connecting of new subscribers had been retarded by delays in the delivery of equipment, but the number had been increased by 10,805 to 141,251. That was a net increase, taking into account changes of address and withdrawals of subscribers; actually 30,000 new lines were installed. There were still 5,000 people awaiting service in Buenos Aires and district. Orders had been placed for equipment which should be sufficient to meet all demands up to January, 1929. The rapidity of development had prevented the company from having that reserve of spare plant which a city of the magnitude of Buenos Aires should possess, but they were doing their best to hasten the manufacture of the apparatus. The company was now in its fortieth year and it had continually kept abreast of developments. Its immediate aim was the provision of automatic exchanges as rapidly as possible. Thirteen of those exchanges were already working in Buenos Aires, Rosario, Cordoba and Santa Fé and six more were in course of erection in the capital, all of which, it was hoped, would be in service early next year. This would give the company an automatic equipment embracing 76,000 lines. They were doing their best to educate subscribers in the use of the automatic system. The work of connecting up Bahia Blanca, 500 miles from Buenos Aires, was completed during the year and the President of the Republic performed the opening ceremony. The company was installing repeating equipment in Buenos Aires which would enable calls to be made between Cordoba and Bahia Blanca, a distance of nearly 1,000 miles. The traffic between those important cities was encouraging and additions would soon be rendered necessary. The trunk service was increasing to such an extent that it would probably be necessary to substitute cable for the existing overhead lines between Buenos Aires and Rosario and Mar del Plata. That would involve heavy expenditure which, however, would be justified within a short period. If necessary the Government would be asked to sanction increased rates for the seasonal traffic between Buenos Aires and Mar del Plata. The matter was still being studied, but it could not be completed for some time. Further capital would be required and the shareholders were asked to approve an increase in the nominal share capital from £5,000,000 to £6,000,000 by the creation of 200,000 £5 shares which would be issued at the appropriate time. After giving some statistics of the company's system the chairman referred to the visit of the Prince of Wales to Argentina, when the local chairman was honoured, and to the recent death of Dr. O'Farrell, a former local chairman. The report and accounts were adopted and the proposed increase in the capital was approved.

Cawnpore Electric Supply Corporation, Ltd.

Mr. J. G. B. Stone occupied the chair at the annual meeting on June 8th and in the course of his speech said that the earnings, the surplus available and the amount of energy sold had all increased. The load factor had improved on account of an increase in the amount of electricity supplied for industrial purposes. The working expenses of both the electricity supply and traction undertakings had increased with the increased business. The traction expenses had been increased by a new item—two motor omnibuses which the company was running as an experiment with a view to meeting competition. The capital expenditure in India during the year was £126,433. That represented expenditure upon the extension of the Riverside station, the payment for which had been completed within a few thousand pounds, and new mains. Mr. Stone said that in the course of a recent visit to India he gathered that Cawnpore was growing in importance as a manufacturing city and the company's prospects were good. Great benefit should accrue from the railway reconstruction which was in hand. At present the company was only dealing with half the load which it could carry but in spite of that its rates compared favourably with those in other Indian cities, where facilities for cheap coal were better. The report and accounts were adopted.

India Rubber, Gutta Percha and Telegraph Works Co., Ltd.

In a circular issued to the shareholders under date June 14th, the directors report that the company's trading for the half-year to the end of February was satisfactory. Compared with the corresponding period of last year practically all departments showed improvement. There had been a falling off in the wireless section of the business, but this was much more than covered by the general increase in other directions. The debentures of £400,000 which became due for payment in March were paid off and replaced by a similar issue; the issue was considerably over-subscribed. The interruption of the general strike and the coal trouble will adversely affect the second half of the financial year and it is not yet possible to estimate, even approximately, the effect of these difficulties on the year's results. In these circumstances the directors are unable to recommend the payment of an interim dividend on the ordinary shares, but the half-yearly dividend on the preference shares will be paid as usual on July 1st.

Eastern Extension, Australasia and China Telegraph Co., Ltd.

The annual meeting was held on June 10th. Sir John Denison-Pender, C.B.E., who presided, said that the gross revenue had fallen owing to the reduction of the rates for Australasian traffic. The reduction had, however, been offset by an increase in the volume of traffic in the Straits Settlements and by a slight increase in the Australasian traffic. The former increases in response to tariff reductions could no longer be counted on owing to the existence of lower special rates. During the year two cable ships were sold and their capital cost, less receipts from their sale, was written off. The ships' reserve had again been strengthened after that operation. A

loss on the sale of investments had occurred owing to the fall of the franc but steps had been taken to guard against a repetition of the loss. The duplication of the Cocos-Fremantle section, by means of cable of the "loaded" type, was successfully completed in March. The cable was not yet in full use as experiments to obtain reliable signals at maximum speed were being carried out. An agreement had been made with the Commonwealth Government for the lease of a fast-working land line between Fremantle and Adelaide (1,676 miles) to connect with the new cable. A new office was being constructed at Fremantle and should be completed at an early date. The Darwin office was being enlarged to accommodate the installation of automatic working. The negotiations with the Chinese Telegraph Administration had made no progress and weekly settlements were being enforced. So far payments had been made regularly. The report and accounts were adopted.

Telephone Manufacturing Co., Ltd.

The directors report that there was a loss on trading of £21,212 for the year ended December 31st last, after charging interest, &c., amounting to £32,165 and placing £7,000 to the contingency reserve. For the nineteen months ended December 31st, 1924, there was a net loss of £46,258. The report states that the trading has been handicapped by stringent financial conditions, but nevertheless, an improvement occurred during the year under review. Since the close of the year a scheme for the reorganisation of the company's finances has been adopted and sanctioned by the Court. This will enable the company to discharge the whole of its indebtedness to the bank and to redeem the whole of the income bonds, thereby freeing itself from all interest and other charges. Further working capital will also be provided. The effect of the scheme is already manifest as the amount of work in hand at the close of last month was nearly five times as much as at the corresponding period of 1924. The meeting was to be held yesterday (Thursday).

Sir W. G. Armstrong, Whitworth and Co., Ltd.

The annual meeting of the Company was held on June 8th, when Lord Southborough explained that he had recently been appointed chairman, while Sir Glyn West had resigned, with certain of the directors. Mr. Frater Taylor and Sir A. Kaye Butterworth had joined the board. The chairman then outlined the history of the company since its inception and said that its present difficulties were mainly due to the necessity for finding other work to employ the large works which had been erected or acquired during the war. Other circumstances which had contributed to the position were the investing of large sums in works which had not proved profitable—or immediately profitable, and the acceptance of large orders showing a small margin of profit or on deferred payment terms. The company's affairs were being thoroughly investigated by Mr. Frater Taylor, who had had wide experience, and it was hoped to present a full report and recommendations in due course.

Delhi Electric Tramways and Lighting Co., Ltd.

The company's lighting and tramway undertakings had a net revenue of £45,019 for 1925. After deducting expenses and debenture interest, and adding £1,974 brought forward, there remains £46,882, which it is proposed to deal with as follows:—Depreciation of plant and equipment, £17,500; reserve for British and Indian taxation, £5,000; renewals reserve account, £5,000; employés' provident fund, £2,000; a dividend of 12 per cent. upon the preferred and participating shares, £12,000; and a dividend of 11.1724 per cent. on the ordinary shares, £3,240, leaving £2,142 to be carried forward. Additions costing £20,641 were made to the plant during the year, consisting chiefly of mains, sub-stations and converting plant. The agreement for a bulk supply from the Government generating station to assist the supply has not yet been completed. The meeting was to be held on Wednesday last.

German Companies.

The *Lloyd Dynamo Works Company*, Bremen, reports gross profits of 583,000 marks for 1925 as against 627,000 marks in the previous year. After providing for depreciation and taxes, the accounts show a loss of 158,000 marks, which is extinguished by the balance brought in and by an appropriation from the reserve fund.

The *Voigt and Haeffner Company*, Frankfort-on-Main, states that the exceptionally large volume of orders received in the early part of 1925, was followed by a sudden decline in the autumn, the result being a great increase in the stocks, which, however, have since been considerably reduced. Sale prices were much depressed and it was only about the end of the year that they were brought into some relation to the costs of production. The export trade continued to be exceptionally difficult. The accounts indicate net profits of 664,000 marks, as compared with 655,000 marks in 1924, the dividend remaining at 8 per cent., as in the preceding year.

The *Continental Company for Electrical Undertakings*, Nuremberg, which is a holding concern associated with the Schuckert Company, states that as a result of the growth of the number of consumers the general economic crisis did not fully affect the undertakings in which the company is interested. The financial requirements for extensions were very considerable. The net profit for 1925 amounted to 505,000 marks, as compared with 319,000 marks in the previous year, permitting of the payment of 6 per cent. on the preference shares of 1922, 6 per cent. on those of 1907, and 5 per cent. on the 1925-26 shares, as well as 4 per cent. on the few ordinary shares.

The *Accumulator Works Company*, Berlin and Hagen, reporting on the year 1925, states that extensive new orders for accumulators were received in the first half of the year although prices in various branches were inadequate. The export markets were almost entirely closed as the costs of production owing to the burden of taxation were too high. During the year the orders diminished, owing largely to the sudden depression in the automobile industry, and large dismissals of workmen had to be made. New orders for starter batteries for the mass production of which the workshops had been reconstructed, almost entirely ceased. A beginning was made during the year with the systematic establishment all over Germany of charging stations and repair workshops. After writing off 683,000 marks for depreciation, the accounts show net profit and balance forward amounting to 1,929,000 marks as against 1,200,000 marks in the previous year; the dividend is raised from 5 to 8 per cent.

Austrian Companies.

The shareholders of the *Upper Austrian Water Power and Electric Co.* have approved the directors' scheme of capital reorganisation on a schilling basis. The share capital has been fixed at 12,000,000 schillings, divided into 1,200,000 shares of a nominal value of 10 schillings each. The shareholders will obtain one new share for each 50 old shares they surrender. The company will have a reserve of 3,200,000 schillings. The net profit for 1925 amounted to 666,257 schillings. A dividend of 5 per cent. will be distributed.—*Financial News.*

The accounts of the *Felten and Guilleaume Company*, Vienna, show net profits of 890,000 schillings for 1925, as against 870,000 schillings in the previous year, the dividend being at the rate of 2 schillings per share as in 1924.

Calcutta Tramways Co., Ltd.—The revenue for the year 1925 was £219,044 and the addition of £14,266 brought forward makes £233,310. After providing for debenture interest and preference and interim ordinary dividends there remains £15,956, which it is proposed to allocate as follows:—To depreciation reserve, £60,000; to general reserve, £28,000; written off suspense account, £7,289; to staff provident fund, £2,068; a final dividend of 3½ per cent. on the ordinary shares (making 7½ per cent. for the year) free of tax, £24,500; leaving £37,703 to be carried forward. The reduction of the dividend (from 10 per cent.) and the strengthening of the reserves is considered advisable by the directors on account of motor-omnibus competition, which, however, is said to be declining. The board is continuing its policy of extension of lines and services and increasing the number of omnibuses which act as feeders to the tramway system. Meeting: June 29th.

W. T. Henley's Telegraph Works Co., Ltd.—The accounts for the year ended March 31st last show a net profit of £311,029. From this is deducted £52,398, representing directors' fees, debenture interest, depreciation, &c., and a net balance brought forward of £477,396 is added, making £736,027. Income tax, reconstruction of Holborn Viaduct premises, transfer to reserve (£50,000) and preference and interim ordinary dividends absorbed £134,748, leaving a balance of £601,279. After paying a final dividend of 3s. per share on the ordinary shares (making 4s. for the year) the sum of £503,779 remains to be carried forward. The report records the death of Mr. M. Roberts, a director, and states that the company's business made satisfactory progress during the year under review. The meeting is being held to-day (Friday).

Barcelona Traction, Light and Power Co.—The revenue for the year ended December 31st, 1925, was $3,678,234, and the balance available $3,482,081. The service of bonds absorbed $2,233,985, and a total dividend of 5 per cent. has been paid for the year. The 7 per cent. prior lien "A" bonds were called for redemption on June 1st. The redemption of these bonds put the 6½ per cent. prior lien bonds in the position of a first specific charge upon the whole of the mortgaged assets of the company and a first floating charge upon its general undertaking and assets. The railway revenue decreased during 1925, but the earnings of the combined enterprises showed an increase.

Whitehall Electric Investments, Ltd.—The gross income during the year ended March 31st last was £708,522, as against £612,043 in 1924-25. The net income was £456,102, against £324,491. After providing for the preference dividend it is proposed to make a distribution of 2½ per cent. on the ordinary shares (as compared with *nil* last year), leaving £143,602 to be applied in reduction of discount on debenture stock. It is stated that during 1925 the Cia. Electrica de Tampico resumed payment of its preference dividend and that satisfactory results have been obtained by the other operating companies.

Oxford Electric Co., Ltd.—Messrs. Close Brothers announce that shareholders representing over 70 per cent. of the ordinary share capital of the company have accepted their recent offer for the purchase of the ordinary shares of the company at 28s. per £1 share (equivalent to £7 for the old £5 shares). As the offer was made subject to acceptance by the holders of at least 50 per cent. of the ordinary share capital it now becomes effective.—*Financial Times.*

Chloride Electrical Storage Co., Ltd.—A final dividend of 5 per cent. (actual), free of tax, has been declared, making 10 per cent., free of tax, for the year, plus a tax-free bonus of 2s. per share.

Globe Telegraph & Trust Co., Ltd.—A final dividend of 5s. per share (net) has been declared on the ordinary shares, making 10 per cent. (net) for the year, as in 1924

Kidderminster and District Electric Lighting and Traction Co., Ltd.—The net receipts for the past year amounted to £7,196, which was increased to £7,566 by the balance brought forward. After meeting expenses and allocating £1,000 to renewals and £800 to reserve, it is proposed to pay a dividend of 2½ per cent. on the ordinary shares, leaving £454 to be carried forward. The Kidderminster and Stourport Electric Tramway Co. made a profit of £19, which is added to a balance of £625 brought in and carried forward.

Manila Electric Corporation.—A dividend of 50 cents per share has been declared on the common stock in respect of the quarter ending June 30th.

The directors propose to issue 120,000 additional shares of common stock of no par value at the price of $33 per share and present stockholders are to be given preference. The issue is intended to provide for the redemption of the $3,419,300 outstanding first refunding mortgage gold bonds (due 1942) of the Manila Electric Company.

English Electric Co. of Australia, Ltd.—The net profit for the year ended March 31st last was £10,982, as against £5,601. A dividend of 2½ per cent. has been paid and £23,325 is carried forward. The previous year's dividend was 5 per cent., and 10 per cent. was paid in 1923-24.

Guest, Keen & Nettlefolds, Ltd.—The balance at credit of profit and loss for the year ended March 31st last is £948,297 and the addition of £223,808 brought forward makes available £1,172,105. As previously reported, the final ordinary dividend is 1s. per share, free of tax, again making 10 per cent., tax-free, for the year. £235,639 is carried forward.

Victoria Falls and Transvaal Power Co., Ltd.—The preference shares are to receive a final dividend of 1 per cent., making 10 per cent. for the past year, and a dividend of 3 per cent. in respect of the current half-year. The final dividend on the ordinary shares is 11 per cent., making 14 per cent. for the year, as compared with 12½ per cent. for 1924.

Anglo-Swedish Electric Welding Co., Ltd.—The accounts for the year ended March 31st show a net profit of £6,003, to which is added £5,349 brought forward, making £11,352. It is proposed to pay a dividend of 10 per cent. (against 8 per cent.), to put £3,000 to reserve, and to carry forward £4,602.

Oriental Telephone and Electric Co., Ltd.—The directors recommend a final dividend of 6 per cent. on the ordinary shares, free of tax, making 10 per cent. for the year, free of tax, and a bonus of 2 per cent. tax-free.

Anglo-Argentine Tramways Co., Ltd.—The directors have declared a dividend of 2¾ per cent. on the 5½ first preference shares and one of 3 per cent. on the 6 per cent. preference shares in respect of the half year ending June 30th.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted :—

Shropshire, Worcestershire and Staffordshire Electric Power.—50,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,160,001 to 1,210,000.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Lancashire United Transport and Power Co.—£250,000 6 per cent. first debenture stock, issued at 93 per cent., partly and fully paid.

Howard & Bullough, Ltd.—A final dividend of 2½ per cent. has been declared on the ordinary shares, making 10 per cent. for the year, as in 1924-25.

Shawinigan Water and Power Co.—A dividend of $2 per share on the common stock has been declared in respect of the quarter ending June 30th.

Pinchin, Johnson & Co., Ltd.—The usual half-yearly dividend at the rate of 6½ per cent. has been declared on the preference shares.

Edgar Allen & Co., Ltd.—A dividend of 5 per cent., free of tax, is recommended on the ordinary shares. The 1924 dividend was 2½ per cent.

Brush Electrical Engineering Co., Ltd.—The annual meeting was held on June 14th; a report of the proceedings will appear in our next issue.

Cape Electric Tramways, Ltd.—The ordinary shares are to receive an interim dividend of 3 per cent., free of tax, as in 1925.

Stocks and Shares.

MONDAY EVENING.

CAPITAL continues to flow steadily into Stock Exchange markets. Notwithstanding the uncertainties which hang round the coal position, the investor is helping himself liberally to the new issues that are spread in profusion before him. There is a pronounced willingness to buy investment stocks, and, despite the competition of the newcomers, the older securities are in constant demand. New capital can be placed without any difficulty provided that the issuers have reasonably good stock to offer. The feature of the week so far as electrical descriptions are concerned, is the strength of Underground Electric Railway shares.

A House of Commons Committee has passed the preamble of the London Electric and the Metropolitan District Railway Companies' Bill for power to execute works and to raise additional capital. The estimated cost of the works is about £2,400,000 and the London Electric Company asks for power to raise additional money not exceeding on the whole a million pounds. Underground Electric ordinary shares have had a dramatic jump to 4. The price rose 10s. in a day, and rumour was exceedingly busy in weaving various causes to account for the persistent pressure to buy the shares. The chief reason was the expectation of a reorganisation plan to be published almost at once. It is declared, with a show of some authority, that the Underground Company's £10 shares are to receive 7 1/5 new shares of £1 each in a reorganisation, and that the 1s. "A" shares will be exchanged at the rate of 10 of these for 11 new shares. The income bonds have risen to 101. Districts, after a drop to 51½, recovered to 53. Metropolitans are a point lower on the week.

In the market for electricity supply shares, Kensingtons are better at 13⅜ and Bournemouth & Poole recovered to 57s. 6d. The Brompton & Kensington Electricity Supply Company has announced to its customers that, as its electrical energy supply is generated exclusively by oil fuel, the restriction in consumption required by the Government order does not apply to the company's consumers. "You are therefore not called upon to practice," says the circular, "the economy demanded by the shortage of coal." Several of the preference shares are better. Midland Counties Electric hardened to a guinea. Whitehall Electric preference strengthened to 20s. 3d., upon the declaration of a dividend on the ordinary shares. This market as a whole shows a good deal of steadiness.

Cable stocks are good. Eastern ordinary gained 3½, Eastern Extensions, Globes and Westerns have all advanced. This is due not only to the satisfactory reports published by the companies, but to the persistence of an investment demand to which reference has been made so constantly. Dividends deducted from the prices of such sound stocks and shares as are found in the Eastern group, are recovered promptly, and the difficulty is to find stock to satisfy the would-be purchasers.

British Electric Tractions have gained another point at 134½, on the strong hint provided at the meeting in regard to the possibility of a bonus. It seems likely that the ordinary stock will be converted into an 8 per cent. issue; after which, deferred stock will be given, to rank for profits over and above the 8 per cent. to which the existing ordinary and preference stocks will become entitled. Apparently it is the coal strike which has delayed the suggestion from being put into practical effect, but stockholders will doubtless be ready to possess their souls, and the stocks, in patience.

Mexican issues are again harder, the Tramway Company's bonds being substantially better, while Mexican Light & Power preferred put on a point. Brazilian Tractions have advanced to a trifle over par. Anglo-Argentine Second preferences are ⅛ up at 2⅞. The Barcelona Traction, Light & Power Company reports a remarkable increase in earnings, the balance available for dividends being 1¼ million dollars against a bagatelle of $75,000 in the previous twelve months. The company's preference shares are now receiving their full 5 per cent. dividend, and the common shares have risen to 30. Tokyo Electric Sixes at 93 are 1 up.

Metropolitan-Vickers ordinary have strengthened to 24s. 6d. The company has obtained an important contract from the Great Indian Peninsula Railway for work to be done on the main line electrification from Bombay to Poona. Forty-one electric locomotives, of a total value of over £650,000, have been ordered. Edison-Swans are a good market at 10s. 3d., showing a rise of a florin, and British Aluminiums gained half-a-crown at 2¼. British Insulated are 1/16 higher at 3 5/16. The wireless group is quiet, Marconis being 1/16 off at 1 3/16 and Canadians a little heavy at 4s. 3d.

The Telephone Manufacturing Company reports a loss for 1925 of £21,200, as against a loss of £46,200 for 1924. The Board has re-valued the company's assets, and thus obtained a surplus of £148,400 for the balance-sheet. By the aid of this, the debit balance on profit and loss account, and various other items, have been written off, leaving £23,274, now placed to special reserve. The company's business has improved, and the price of the ordinary shares advanced to 8s. Henley's fine report shows a profit of £311,000 for the year, compared with £361,400 for the previous 15 months. At 4, the price of the shares remains unchanged. Oriental Telephones keep at 43s. 9d.; the company's report announces that the sale of the China and Japan Telephone Company, a subsidiary of the Oriental Telephone, was satisfied partly in cash and partly in shares of the new concern, the Hongkong Telephone Company.

Calcutta Tramways at 18s. 9d. are unaffected by a reduction from 10 per cent. to 7 per cent., both tax-free, in the dividend. The revenue balance of £226,800 is about £11,000 less than that for 1924, and the directors have decided to conserve the company's resources owing to private omnibus competition and the commercial unrest that has lately occurred.

Engineering shares hold their values, but the iron and steel market is naturally dull, owing to the coal position. Rubber shares are a shade better, which is more than can be said for the amount of business doing in them.

We have frequently criticised the Electric Light & Power Contracts Finance Corporation and the Warwickshire and South Midland Electricity Supply Corporation. Both these companies were fined £20 and five guineas costs last week for having failed to file their annual summaries of account at Somerset House. Sir Charles B. H. Soame, Bart., and various directors were fined £20 each for permitting the default. Walter Thompson, solicitor, of West Hampstead, is a director of both concerns; he was required to pay only one fine. Lord Ilkeston, the stipendiary before whom the cases came, said it was very necessary that the provisions of the Act should be observed by those responsible for carrying on the business of public companies. The returns have been filed this month.

A Long Transmission-Line Span.—What is claimed to be the longest span in an overhead transmission line is in course of erection across the Narrows of Puget Sound (United States). The channel is 4,800 ft. wide, flanked by cliffs about 300 ft. high. The sites for the towers are some distance from the water, making the total distance between them 6,240 ft. To comply with Government directions that the lines must have a minimum clearance of 200 ft. over the water the towers have been made 316 ft. high, and their elevated situation will permit of a maximum sag of 397 ft. The span will be in duplicate, necessitating a pair of towers on each bank of the Sound. The maximum computed reaction at the base of each tower is 310,000 lb. The line will be operated at 110,000 V.

Commodity or Privilege?—In some respects the business of electricity supply in the United States resembles our own practice very closely. In a recent address, reported in the *Electrical World*, Mr. J. C. Parker, vice-president of the Brooklyn Edison Co., said:—"A lay customer . . . who oughtn't to have to know anything about our miserable technique . . . just naturally can't come up to the counter and ask for 50 kWh to be wrapped up in a neat bundle and delivered to his house charged to his monthly account, but rather has to go through making an application in which he subscribes to a fine-print waiver of all his property, his rights as an American citizen and his hopes of everlasting salvation. He then runs the gamut of the credit department and the claim bureau and negotiates with his contractor and then gets a violation slapped on by the company or any one of a half a dozen official bodies, and, in the course of time just before he is gathered to his fathers he has opportunity to make a limited and restricted use of the commodity in which we claim to be rendering public service."

The Incorporated Municipal Electrical Association.

Annual Convention at Glasgow.

The I.M.E.A., with admirable courage—doubtless inspired by the Scottish resolution of its President, Mr. R. B. Mitchell—determined to hold its annual Convention, coal or no coal, and therefore assembled at Glasgow last Monday evening, to carry out at least the essential items of its programme, and as many of the social events as possible. Some curtailment of the programme was inevitable, but not so much as to detract seriously from the success of the meeting, though it could not be expected that so large a gathering would be recorded as in normal times. It will be remembered that in 1915, when Major H. Richardson, of Dundee, was president, no convention was held, and again in 1921, with Major Richardson a second time as president, the convention was cancelled on account of the coal stoppage; it is therefore a long time since the Association has met in Scotland, the last occasion being the Glasgow Convention of 1910, when Mr. W. W. Lackie was president. Those who were present on that occasion and partook of the lavish hospitality of the "Second City" would cordially endorse the decision of the Executive Council, and by the time these notes are read the many members who have now enjoyed the same experience for the first time will have realised that the Scot hides a warm heart under a sometimes rugged exterior.

Of Mr. R. B. Mitchell's career in electrical engineering we gave an account in our issue of July 3rd, 1925; a Glasgow man by birth and inclination, he has served the Corporation continuously for 28 years, becoming the head of his department six years ago—a record of which he may well be proud; carrying on the high traditions of his predecessors, he has maintained the efficiency of the Glasgow Electricity Department at the utmost pitch, and stands high in the esteem of the Corporation, as well as of his brother engineers. That he has left nothing undone to ensure the success of the Convention in spite of the difficulties of the time is certain, and in that aim he has had the hearty support of the staff of the Department.

Glasgow, as a great industrial centre, situated in a district rich in mineral wealth, and bestriding a river which for over a hundred years has been made navigable at great cost, has long possessed world-wide fame for its engineering works and achievements, and has been the home of many distinguished scientists, engineers, and administrators, the greatest of whom was Lord Kelvin. The population of the City is well over a million, and it covers 30,000 acres.

The government of Glasgow has been held up as an example of wise and prudent municipal administration for generations; the public services are admirably planned and efficiently conducted, and in every sense the city is up to date. Elsewhere in this issue we give an account of the Dalmarnock power station, designed by Mr. W. W. Lackie and extended by Mr. R. B. Mitchell; this plant is one of the most economical in the country, and has been visited by many engineers from overseas. The undertaking has over 61,000 consumers connected, to whom last year it sold 175 million kWh; it supplies power to 17,297 motors aggregating 140,000 h.p., and feeds over 4,000 street lamps. The total capital expended approaches nine millions sterling, but the net debt is only 5½ millions; the total revenue for the year 1924-25 was £1,242,118, and the average price received was 1.639d. per kWh sold. The Electricity Committee, of which Councillor Dr. D. McK. Dewar is Convener, has adopted a progressive policy, and is developing the domestic side of the business with assiduity; it has over 10,000 cookers, radiators and other apparatus out on hire, and supplies a total of 54,000 appliances of this class, having a total capacity of 72,150 kW. The Committee, under the advice of Mr. R. B. Mitchell, has instituted an assisted-wiring scheme, under which 2,000 houses have already been equipped.

Some 700 members and visitors attended the Convention on the first day, when fair weather prevailed. The organising work of the secretary, Miss Lanfear, and her staff was carried on under a heavy handicap, and they are entitled to the sympathy which the members have extended to them. Writing before the event, we believe the charming cruise in the Firth of Clyde which was planned for Wednesday afternoon, at the invitation of Messrs. Babcock & Wilcox, to follow the visit to that company's Renfrew works, will not take place—a sore disappointment to those who have enjoyed the trip on previous occasions, but unavoidable in view of the shortage of coal, and other obstacles.

The programme was opened on Monday with a reception by the President and Mrs. Mitchell, Dr. Dewar and Mrs. Dewar, followed by dancing and a display of kinema films on subjects of electrical interest arranged by E.D.A. On Tuesday the Convention was opened with a civic welcome by the Lord Provost, Sir Matthew W. Montgomery, after which Mr. Mitchell read his presidential address; the ladies then placed themselves in the care of Mrs. R. B. Mitchell, and visited the Electrical Exhibition, whilst Mr. S. E. Britton, M.I.E.E., read a paper on "Supplies to Outlying Districts." After the Corporation had entertained the visitors at luncheon, they were photographed in Linn Park, and proceeded to Dalmarnock power station. In the evening the Lord Provost and magistrates held a reception in the City Chambers, which was followed by dancing and a concert.

On Wednesday the works of Messrs. Babcock & Wilcox were visited, the party afterwards travelling to Gleneagles, where dinner was served, the return to Glasgow being by special train.

(To be continued.)

Presidential Address.

By R. B. Mitchell (Engineer and Manager, Glasgow Corporation Electricity Department).—*Abstract.*

As one of the Council's representatives on the British delegation of the International Electrotechnical Commission, I attended the Conference in New York and subsequently joined in a tour to all the principal cities of the United States and Canada. It was good to see the enthusiasm and amity which prevailed at the Conference and satisfactory to learn that greater progress had been made towards unanimity at this year's meetings than ever before. Apart from the technical side of its work, this Commission is really and truly a League of Nations in the best sense; its work will do a very great deal to promote good feeling and to induce international friendship.

Density of Load in United States Towns.

The first impression made upon my mind by the skyscrapers of New York was one of envy. What a place in which to supply electricity! Beyond doubt, there is to be had there a greater consumption of electricity per square foot of area than in any other city in the world. In one part of the area one-quarter mile square, the density is estimated to be at the rate of 280,000 kW of actual load per square mile. Any electrical undertaking operating in such a city has every prospect of success.

Rural Supplies.

There is the other side of the picture when we survey the vast extent of rural areas where the population is very scanty, and possible consumers cannot average more than five to the mile. Nevertheless, supply is being given, although the load to be obtained cannot possibly be remunerative for a long time to come.

In general, the rates of charge for rural supply are the same as for the metropolitan areas. It is recognised that the bad must be taken along with the good, and this is a problem which we, in this country, are to be faced with very soon if the ideals formulated in the Weir Report are ever to come to fruition.

It must not be forgotten, however, that the main justification for interconnection is the mutual benefit to be derived by developed areas by this interconnection. The supplies given to the rural areas on the route of the transmission lines are merely incidental, but are certainly of great benefit to those areas when once established.

New York Edison Company—Distribution.

The New York Edison Company is maintaining perhaps the most expensive system of distribution existing at the present time, and one which we, in this country, are trying to break away from. The supply is direct current at the low pressure of 120 volts. All cables are laid in ducts, and batteries, installed in sub-stations, are floating continuously on the network, to come into action in the event of a breakdown of the generating plant. Justification is claimed for this large expenditure because of the special conditions which exist, and particularly the installation of storage batteries is justified because of the serious consequences which might result from a failure of supply in that very congested area.

Power Stations.

In inspecting power stations in America, one is impressed by the size of the generating sets. I visited ten stations belonging to public utility undertakings, and I did not see any sets in use of less than 15,000 kW, and these formed a very small proportion. For the most part, capacities were of 35,000 kW and upwards, and it is the intention in one plant to install, at an early date, a unit of 100,000 kW. We are not in a position at the present time to follow that example. When interconnection becomes more general and extends over wide areas, the position may be very different.

Apart from the size of the turbo-alternators, which is the main feature of the power plants in America, one very important development is taking place there—the introduction of the high-pressure turbo-alternator, taking steam from a separate boiler at about 1,200 lb. pressure, and exhausting into the main steam range at the pressure of the main boilers. One plant of this description was seen at Weymouth station, in Boston, in operation, and another in course of construction at Milwaukee. This development may prove a means of making our moderately-efficient stations still more efficient without heavy capital expenditure, and without much scrapping of what may be still good and useful plant. It is estimated that, under good conditions, a saving of 7 per cent. can be obtained by the superposing of this high-pressure set on the ordinary sets in a power station.

Particular note was taken of the plants which were operating with pulverised fuel. Considerable experience has now been had in America with this form of firing, and comparisons have been made with equivalent stoker firing. In all cases under our review, complete satisfaction was expressed with pulverised-fuel firing, and I think there can be no doubt that, as larger and larger boilers are demanded, we on this side shall be driven to adopt this equipment. Large-capacity boilers need large stokers. The larger the stoker, the weaker it is in proportion and the more complicated. It is at this point that pulverised fuel becomes worthy of serious consideration. In the building of stokers a high degree of perfection has been attained. One travelling-grate stoker, 40 ft. wide, was seen in operation in one of the stations visited.

Attention should be called to the extent to which automatic boiler control has been developed in the States. In all large boiler rooms we find these equipments working with satisfaction to the users. I have no doubt that, at an early date, this matter will receive the attention here which it undoubtedly deserves.

A stigma which has been attached to the generation of electricity from coal during the whole period of public supply, in that the burning of crude coal was wasteful and wrong, has now good prospects of being removed. In Milwaukee, at Lakeside power station, I saw, completed, an installation for the treatment of coal in the pulverised form which, if expectations are realised, will enable valuable by-products to be extracted, before the residual, in the form of pulverised coke, is sent to the boilers. A saving in fuel costs calculated at 50 per cent. is expected to be the outcome, and if this be the happy result, a reproach long levelled at us by our gas friends will no longer be justified.

As regards the cost of power stations in the United States, the figure of £25 per kilowatt installed is considered nowadays to be quite moderate. In this country it would be deemed to be very much too high.

Cost of Electricity.

With regard to the rates at which electricity is sold in New York and other large U.S. cities generally, our own rates of charge compare very favourably with these, and in many of our undertakings they are much lower. The impression undoubtedly exists in this country that we are much behind in this respect, and it is time that an emphatic contradiction was tabled.

Supply engineers over there venture the opinion that the rates in this country are unnecessarily low, and point to their own extraordinary development as proof of the correctness of that statement. I do not agree with this opinion. Rates of charge, in municipal as well as company undertakings, should be as low as possible consistent with sound finance, if our consumers are to be able to make full use of what electricity can do for them. In America the ordinary consumer, although quite well-to-do, uses electricity for lighting, and there may be an iron and a vacuum sweeper in his household; but the rates do not permit the use of electricity for much else, and a 3-unit fire would be quite out of the question.

Development.

In spite of these charges, the rapid rate of the development of electricity supply is really astonishing. This fact has often been referred to in the past, and comparisons have been drawn with a view to emphasising our own backwardness.

The latest figure available makes the comparison even worse, namely, that of the record of the Commonwealth Edison Company of Chicago, as published in its last report. The units used per head of the population for the year in question amounted to 1,030, a figure, I believe, excelled only in one other undertaking, also in America.

This rapid development is, of course, due to America being a comparatively new country with any quantity of land ready for occupation, and also to the fact that it is passing through a time of great prosperity.

In Chicago last year lighting and small power was 26 per cent., railway light and power, 30.1 per cent., while power used in industry was 38.6 per cent. of the total, with 5.3 per cent. sold to other undertakings. In 1907 more than half (55 per cent.) of the total output of this company was for railway use, and lighting and small power amounted to 43 per cent. of the total.

These figures are interesting and show the extent to which the electrification of railways has proceeded in America. Approximately one-third of the output of this very large undertaking is used for railways. We have nothing to compare with this in our country. We all look forward to the day when the percentage of output for railway use, not from one of our undertakings only, but for the whole country, will approach the figure I have given above. These figures bring out another interesting point, *viz.*, that if the output for railway use is deducted, the units-used-*per-capita* figure becomes about 700. As the overall figure for this country is about 200, we still show up very badly in comparison.

Showrooms.

The showrooms of the electricity supply undertakings of the United States are an object-lesson to us in this country. Everything is done on what would be considered here a very lavish scale. An amount of space which we would consider excessive is allocated to showrooms, although it would seem that only the domestic side is catered for. No simple hiring of appliances is undertaken, but almost every sale is made on a deferred payment system. In one undertaking, the showroom sales amount to £1,000,000 per annum, and about 90 per cent. of this sum is received in instalments. In Chicago 48,000 irons were sold in one year, and in the same period five and a quarter million lamps were given out on the free-replacement system. Anything can be obtained on deferred-payment terms, from a house to a motor-car, and there is no doubt that business is stimulated thereby. We would do well to copy, to some extent at least, this example set by our American friends.

Domestic Load.

As with us, the importance of the domestic load has been recognised by supply authorities, and despite the high rates in force, great efforts are being made in many undertakings to induce domestic consumers to use electricity for purposes other than lighting. The re-laying of distribution mains in residential areas is faced quite cheerfully, the increased returns being confidently expected to make the expenditure well worth while. This may be a lesson to some of our own members who have hesitated to encourage, or have even discouraged, the use of appliances for purposes other than lighting by their domestic consumers.

Refrigerators.

In every showroom visited, the domestic refrigerator was found very much in evidence, and its sale being pushed energetically. This appliance is receiving at the present time, from sales managers in the States, more attention than any other. It has arrived now at a state of perfection which makes it a very reliable and very desirable part of every kitchen equipment. I am not prepared to say that in our climate it is so essential in the household as it is under American conditions, but there is a large field for it in hotels, restaurants, &c., and that field ought to be explored by everyone interested without delay.

Service.

The motto "Service to the Consumer and Prospective Consumer" has been adopted in all earnestness by the public supply undertakings in the United States. A telephone system dealing with "service" only is worked at the highest efficiency. Prompt attention is given to all complaints, broken-down appliances are repaired in the shortest possible time, and every care is taken to ensure that there is not one dissatisfied consumer. Research departments are maintained, and these are regularly called into assist in solving some problem which may have arisen on the selling side, involving the use of the company's supply. We would do well to follow this very good example.

Electric Vehicles.

The electric vehicle is making headway. I found that in New York city there are now some 4,000 vehicles working regularly, and their number is steadily increasing. One large biscuit factory has one hundred 5-ton wagons in use on its transport services. The agreement with the supply company

restricts the supply of energy for battery-charging purposes to the night hours.

The development of this business means not only increased consumption, but load-factor improvement.

To sum up, one can only conclude from these observations that in the United States they, in many respects but not all, are well ahead of us in things electrical. They are thoroughly converted to the super-power idea; they believe in big plants and in interconnection over wide areas; they are going for maximum reliability and efficiency, the former always being placed first. The men at the head of affairs are very proud of what has been achieved and of the people who have helped to bring about the present state of development.

Electricity Supply to Outlying Districts.

By S. E. Britton.—*Abstract.*

The paper deals with the supply of electricity by authorised undertakers to districts which are adjacent to, or within the economic limits of, secondary transmission and low-voltage distribution from their own stations, but are at present not served with electricity.

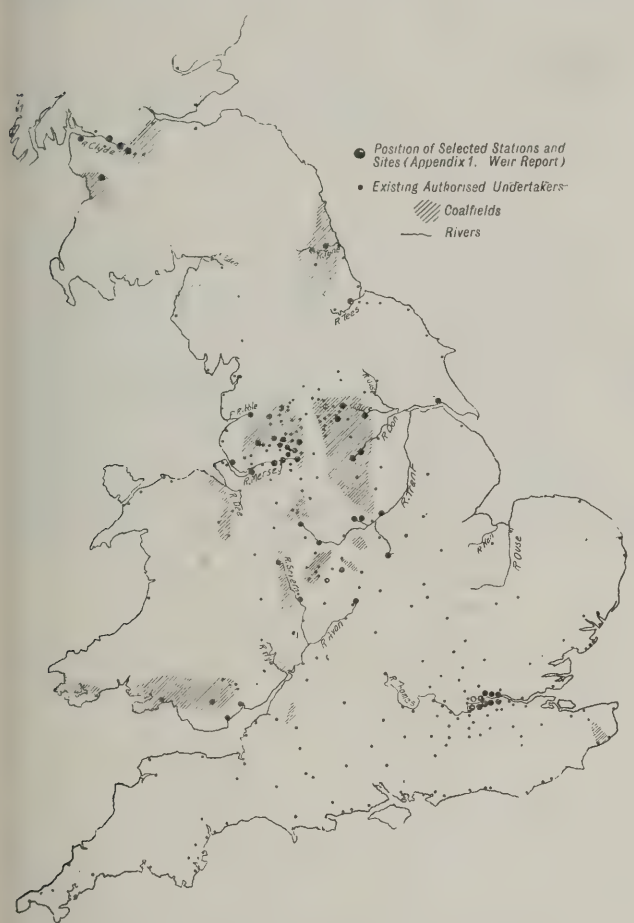

Fig. 1.—Generating Station Sites and Coalfields.

One of the reasons for the present unsatisfactory progress is that there are now available sufficient cases of inconsistency in the administration of the Electricity (Supply) Acts to justify the mistrust and uncertainty prevalent throughout the industry.

The methods of constituting Joint Electricity Authorities and of dealing with applications for Special Orders under the 1919 Act have been most effective in encouraging super-parochialism. The effect of collecting together hundreds of people from a district thousands of square miles in area, the majority of whom have no knowledge of how electricity is generated and supplied, representative of all the various forms of local government, and asking such an ill-assorted band to consider schemes for affording a supply over a large area, cannot be expected to lead to a satisfactory result. One of the fundamental provisions of the 1919 Act, therefore, instead of checking parochialism, is responsible for the continuance of a condition which it is vitally important to remove.

Figs. 2 and 3.—Existing Areas Authorised Undertakings could supply with Secondary Transmission (left) at 6,600 V and (right) at 11,000 V.

The registrar-general's Statistical Review of England and Wales for the year 1924 contains a record of deaths from various causes, including the following:—

Cause.	1919.	1920.	1921.	1922.	1923.	1924.	Total.
Accidental burns ...	2,095	1,785	1,588	1,722	1,608	1,565	10,363
Machinery	326	329	180	192	213	229	1,488
Vehicles, Railways, &c.	3,730	3,826	3,496	3,485	3,751	4,436	22,724
Injury by animals ...	111	69	84	63	63	66	456
Lightning	5	11	3	4	8	12	43
Electricity	32	26	19	21	25	37	160

which figures emphasise the fact that electricity is not necessarily as dangerous as the severity of the regulations issued by the Electricity Commissioners and the Postmaster-General would lead the public to imagine. The inconsistencies in the relationships of the electricity supply with telephone and telegraph services, together with the rules for obtaining wayleaves, are amazing. It is incredible that matters have not been improved before attempting to formulate the Electricity (Supply) Bill, 1926. It is abundantly clear that the industry cannot be efficiently carried on when such details as lopping trees and wayleaves have to be referred to the Electricity Commissioners and the Minister of Transport in London. Given suitable legislation, these matters at once become matters of routine and local interest only; they can, therefore, be settled in a more satisfactory manner and by less costly public officials than those now entrusted with them. It is suggested that the land agent of county council estate departments might be appointed to settle such matters on the spot on payment of a standard fee, plus out-of-pocket expenses; the procedure might be somewhat similar to that adopted in appointing an electrical inspector under the Electric Lighting Clauses Act, 1899.

While parochialism is not a charge usually levied against private enterprise, or power companies, with a few exceptions their attitude towards the development of their areas has been narrow-minded; they have confined their attention to the most thickly populated and industrialised parts in much the same way as local authorities have done. The country cannot afford to allow the development of a scheme to be sport for politicians, or men of intriguing propensities, neither are the decisions of the Electricity Commissioners and the Minister of Transport in respect of applications for Special Orders for distribution powers always free from the reproach of parochialism.

The decisions regarding the district of which Chester forms the centre justify the opinion that London is not a suitable place from which to arrive at a correct and final judgment on the technical, administrative, and economical merits of proposals for the development of the supply of electricity in rural areas. An instance of how *not* to proceed has recently been provided by the Wirral Rural District Council, which attempted to develop a distribution scheme in its area. The Electricity Commissioners approved of Wirral's application for a Special Order, and eventually a scheme was formulated and application was made to the Commissioners for sanction to borrow £180,000 to enable it to be carried out. At the public inquiry into the application it was stated that agreements for bulk supplies of electricity had been prepared between the Rural District Council and the Mersey Power Co. and the Wallasey Corporation respectively, based on a kilowatt charge and a price per unit, with a minimum payment per annum irrespective of the quantity of electricity taken, thus safeguarding both the Company and the Corporation against loss in giving a bulk supply. The estimates of income and expenditure for operating the undertaking during the initial stage showed a loss of about £9,000, if the maximum price allowed by the Special Order was charged, whereas figs. 2 and 3 indicate that the area of the Wirral Rural District Council could be more economically supplied by ignoring the District Council's boundaries and attaching it to the area of one, or more, of the adjoining authorised undertakers.

If it is admitted that large quantities of cheap electricity can be generated in this country only where there is abundant natural water for condensing purposes in close proximity to

the coalfields, then such localities are limited to a few districts. A national scheme therefore resolves itself into: (*a*) Generation in comparatively few localities; (*b*) a comprehensive system of transmission; and (*c*) extensive areas of distribution.

Fig. 1 shows lengths of rivers which have at least 800 square miles of catchment area and estuaries that have water available for generating stations with a plant capacity of 100,000 kW and upwards, the coalfields, the selected stations referred to on pages 26, 27, 28, 29, and 30 of the Weir Report, and other authorised undertakings. This map indicates the proximity of the "selected" stations to natural water and the coalfields and the extent to which the undertakings are distributed over the country; also how illogical it is to constitute Joint Electricity Authorities to generate electricity in the districts which have so far been delimited, and emphasises the necessity of generating stations being erected with a view to meeting the requirements of the country as a whole.

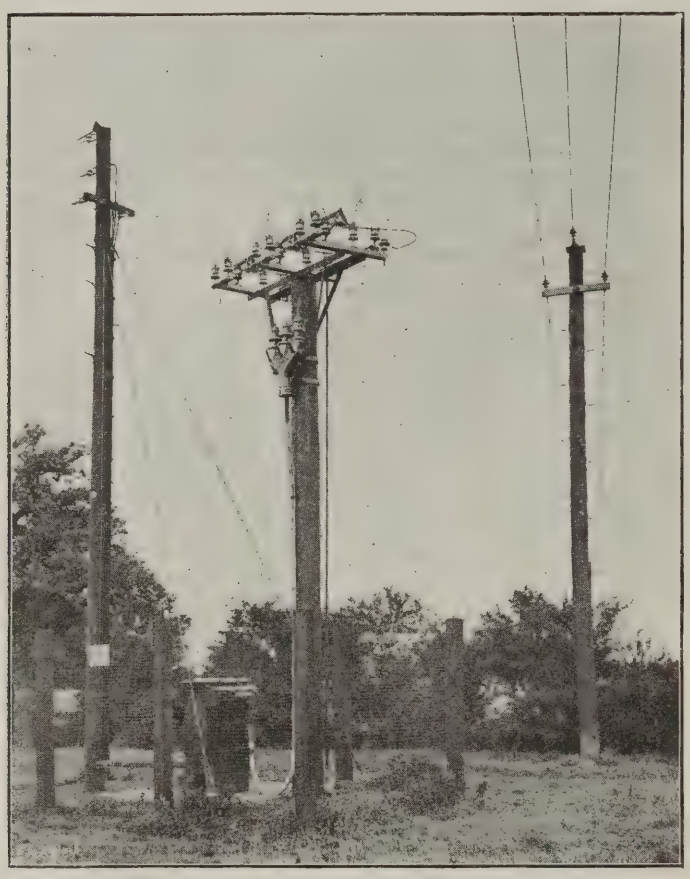

Fig. 4.—A 6,600/400-V Transformer Sub-station, Controlled by 6,600-V Outdoor Switchgear.

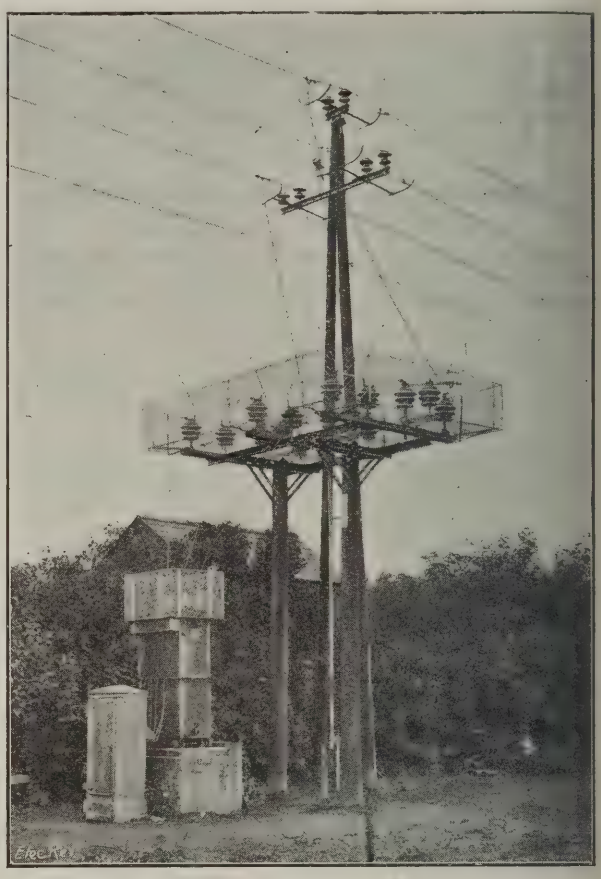

Fig. 6.—A 33,000/460-V Transformer Sub-station, Controlled by 33,000-V Outdoor Switchgear.

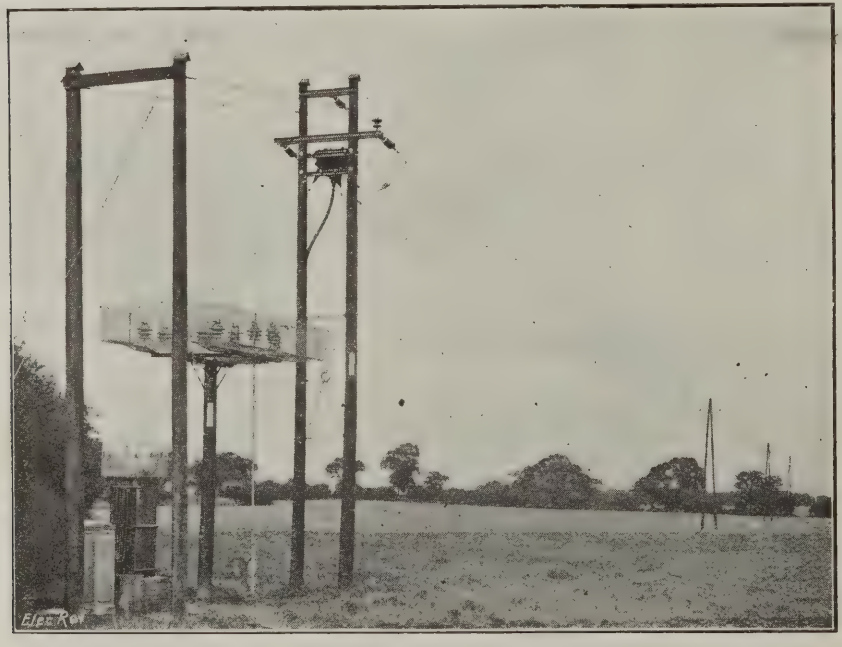

Fig. 5.—Outdoor 33,000/460-V Sub-station.

Figs. 2 and 3 show the positions of all authorised undertakers, except the smallest, and the areas they would cover if their systems of distribution were extended to the limits of transmission at 6,600 and 11,000 volts respectively, as well as the effect of covering the whole of the country with distributors of electricity. They indicate the necessity for withholding, for a specified time, the grant of Special Orders to those who are not already authorised undertakers so as to enable existing undertakers to investigate the potentialities of the areas which lie within the economic limits of 6,600 and 11,000 volts respectively from their stations. This would be better than adopting the proposals contained in paragraphs 70 to 78 of the Weir Report. (*To be concluded.*)

The I.M.E.A. Exhibition.

In connection with the Convention an exhibition of electrical apparatus is being held at the McLellan Galleries, Sauchiehall Street, where floor space of about 10,000 square feet is being utilised by some twenty-four manufacturers, the Electricity Department of the Corporation of Glasgow, the E.L.M.A. Lighting Service Bureau, the British Electrical Development Association, and the Electrical Association for Women. The displays cover the whole range of modern lighting, heating, cooking and labour-saving appliances, electro-medical applications, water heating and refrigeration. In addition, a number of special exhibits of interest

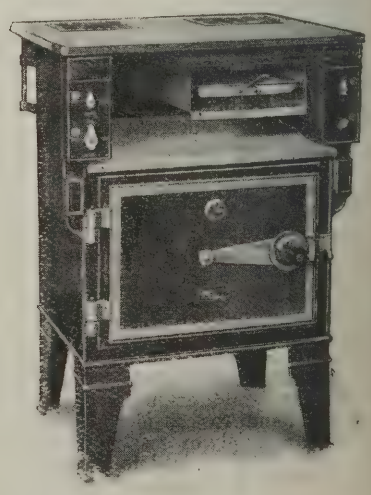

Fig. 1.—A Modern Electric Cooker.

to engineers include thermostats, meters of special types, heat-storage apparatus, industrial heating appliances, and new wiring methods. The exhibition is open to members of the Convention and to the general public at specified times.

The General Electric Co., Ltd., is exhibiting a wide range of its products, including "Magnet" electric cooking apparatus, and electric suction cleaners, the latter being manufactured throughout in Great Britain and sold exclusively through the electrical trade. The running cost of the cleaner is approximately one half-penny per hour. Fig. 1 shows the maker's H.7500 model electric cooker. A full range of "Gecoray" shop-window lighting reflectors, various lighting units, "Freezor" electric fans, and numerous types of "Osram" lamps are among the other exhibits. Owing to the limited amount of space available on the stand at the Convention, a special display is also being made of the Company's products at its Glasgow showrooms, where demonstrations, "Doing it Electrically," are being featured throughout the period of the Convention.

A representative selection of the various models of "Creda" electric cookers is to be seen on the stand of Credenda Conduits Co., Ltd. This includes five models from a size convenient for two up to a large cooker suitable for 18 persons. The special feature of these cookers is the embodiment of "plug-in" elements. Considerable interest is being shown in the new "Globar"-pattern elements for boiling plates and grills. In these a new resistance material, "Globar" (Electrical Review, May 7th, p. 761), is employed, which marks a departure from the usual nichrome alloy. The advantages claimed for the "Globar" rods are that they are unaffected by any liquids being spilt on them, and even a piece of wire laid across two of the rods, causing a dead short, will do no harm beyond blowing the fuses. A very long life is claimed for the material, and it has the further advantage that a very high loading can be obtained, as much as 3,000 watts being possible on a standard 7 in. by 7 in. hot plate. "Globar" elements can be fitted as an alternative to the firm's standard element at a slight extra cost. The other exhibits of this company include a new series of electric kettles, having automatic protective devices, and a very neat wash boiler. A few electric fires embodying the "Crater" fire bars are also on view.

The Siemens & English Electric Lamp Co., Ltd., is exhibiting a selection of "Siemens-Xcel" electric domestic appliances, including electric irons, kettles, fires and electric cookers. The fires comprise various types of well fires and those of the imitation-coal type. The cookers, which have been designed with a view to efficiency in use combined with simplicity in operation, have boiling plates of special patented design, circular, 7 in. diameter, so arranged that the utensils are in close proximity to the spirals. These are supported in grooves and arranged so that on medium heat the centre spiral only is in circuit, giving practically the equivalent of full heat for a small pan with only half loading, and avoiding the wastage of heat from uncovered spirals. A feature is the ease with which the elements may be replaced. Plug-in terminals are adopted for both the boiling plates and the grills. The grill, which is fitted with 3-heat control, is provided with a damper plate, which, when removed, exposes a circular portion of the grill element, and renders the unit suitable for boiling purposes. The hobplate is hinged. The oven elements are arranged on busbars, and are easily removed by slackening two screws. The "Xcel" No. 1 iron is made in various weights and is fitted with a patented side-entrance connector which keeps the flex away from the user's arm and obviates one of the common troubles with irons, *viz.*, the failure of the lead caused by the continual pulling out of the connector by means of the wire. A thumb grip is provided, which must be used to remove the connector, and a special steel bell-mouthed entry prevents wear on the flex.

A very attractive stand is that of the British Thomson-Houston Co., Ltd. An important feature of the exhibit is the "No-Lag" induction motor, which is being shown for the first time. This machine (Electrical Review, February 12th, 1926, p. 271), in addition to possessing all the advantages of an ordinary induction motor, operates at practically unity power

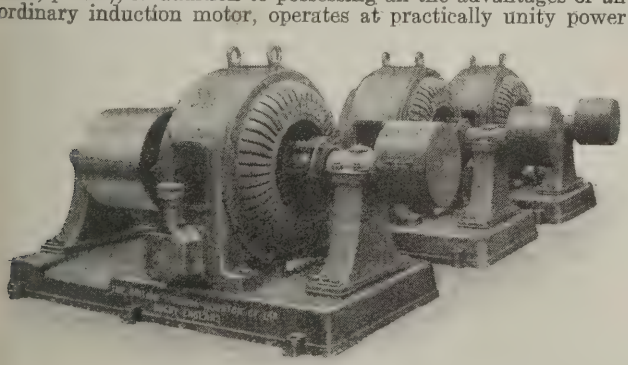

Fig. 2.—B.T.-H. "No-Lag" Induction Motors.

factor over the entire load range. The "No-Lag" motor can be supplied to give a leading power factor of 90 per cent. at full load, thereby improving the power factor of the system when working with other motors of the ordinary induction type. At the same time, it is claimed, the "No-Lag" motor will take its full rated load. Fig. 2 shows a group of "No-Lag" induction motors, each rated at 250 h.p., 600 r.p.m., 433 V, 3-phase, 50 cycles.

An exhibit of motor-control gear representing recent advances in this direction is of particular interest. For d.c. work a very compact unit, comprising a face-plate type starter, fuses, line switch and protective devices, all completely enclosed in an iron case, designed to meet the requirements of motors up to about 18 h.p., is among this equipment, which may be obtained for wall or pillar mounting. An a.c. motor-control pillar has a starting switch of the drum type, built on the lines of the B.T.-H. controllers for crane duties; it has a slow motion, or step by step, starting mechanism with the dead-man's-handle feature. Interlocks are provided to guard against any contingency, and full protective equipment is fitted. Provision is made for routine inspection and testing in a quick, clean and effective manner, all parts being easily accessible for this purpose. Examples of the B.T.-H. fractional horse-power motors are being shown, and also "Tungar" battery chargers for both high- and low-pressure charging. One of the most attractive features of the stand is a wonderful display of "Mazda" lamps, lighting fittings and reflectors. The lighting equipment is ingeniously arranged, and provides effects which are at once striking and artistic. One fascinating item in the lighting section shows some of the possibilities of coloured lighting for shop-window displays. A novel method of presenting a record in an attractive manner of some of this company's products is the use on the stand of illuminated stereoscopic views in colour of a number of important installations of various kinds.

Some models of electric cookers built on the lines of the one described in his paper on "An All-Electric House," read before the Institution of Electrical Engineers by Dr. S. Parker Smith (Electrical Review, December 11th, 1925, p. 951), are among some of the most interesting exhibits. These were built

Fig. 3.—Cooker with Plug-in Utensils.

for Dr. P. Smith by Messrs. Archibald Low & Sons, Ltd. A table model boiling plate is of special interest. For use with this apparatus are three pots—of a substantial type—of 3-, 6- and 9-pint capacity, each fitted with heating elements and arranged for three-heat control. At the back of the bench sockets are fitted to accommodate the three-pin plugs of the utensils; no flexibles are used, the sockets being given a certain freedom of movement in their mountings. It is claimed that the consumption and cost of cooking have been reduced to less than one-half by replacing the two original open boiling plates with utensils having their own heating elements. Most of this saving is due to the high overall efficiency of electrical appliances with self-contained elements, and the rapidity with which the maximum efficiency is attained after switching on, thus rendering such vessels eminently suitable for the short operations which are characteristic of household practice. The model also contains a 3-heat control grill and an enclosed-type boiling plate. The latter is intended for use with utensils for occasional duty. Fig. 3 shows one of the models which is attracting considerable interest. It is of the usual design of domestic cooker, incorporating the self-contained-element utensils and the plug-in principle for the boiling arrangements. The cost of this cooker exceeds that of the ordinary apparatus by the value of the utensils, but it is claimed that the extra charge will be quickly covered by the saving in consumption.

An interesting display of electric water-heating equipment is to be seen on the stand of Messrs. Benham & Sons, Ltd. Several types of electro-vapour radiators and towel rails are being shown, including, of the former, a specially-designed apparatus for use on board ship. A 4-gallon aluminium-lined urn is shown complete with a neat switchboard and the necessary connecting leads. An electro-vapour coil is included

in the exhibits. It is designed for the heating of inaccessible places such as linen cupboards, drying rooms, and garages. This apparatus is made in capacities of 200 W upwards. Other interesting items are electric geysers, fig. 4; these are of the electro-vapour type, and each consists of a

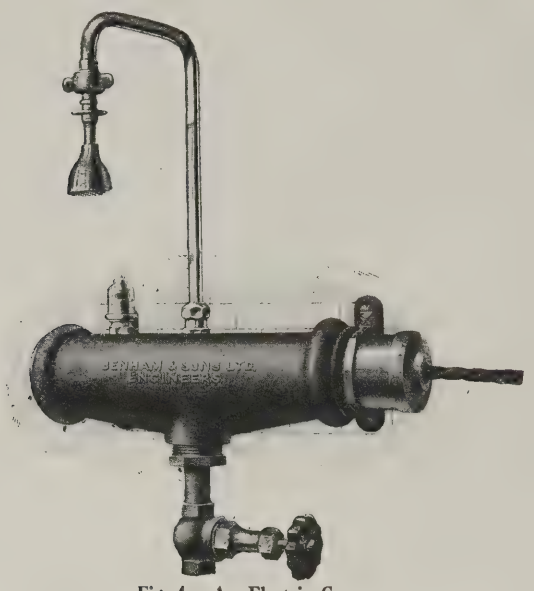

Fig. 4.—An Electric Geyser.

chamber into which one or more "Benham" immersion elements are screwed. Two models shown are of 900- and 2,000-W capacities and are fitted with 1- and 3-heat elements respectively. Other exhibits include a 20-gallon galvanised electric water-heating cylinder and an electric toaster, 12 in. by 12 in.

One of the items included in the display of Messrs. CARRON COMPANY is the firm's No. 616 electrically-heated wash boiler, fig. 5. This has a cast-iron pan with a well as the lowest part, over which is fitted a perforated guard of galvanised sheet steel. The cast-iron legs are connected with a triangular jointing piece. A large-bore draw-off tap is fitted to the pan, and an auxiliary tap is fitted to the base. The boiler is heated by means of two 2-kW immersion heaters fitted in the well. Two "Carron" electric cookers are also being shown, models 310 and 311. Fig. 6 is one of a variety of electric fires which are on view at this stand. This model, 223a, is fitted with a fireclay element which is interchangeable with the firm's patent cast-iron enamelled element. It is 12 in. wide by 19 in. high, and weighs 27 lb. The loading is 1 kW. Other articles shown here include a selection of electric irons, kettles, grills, and boiling plates.

Fig. 5.—Electric Wash-boiler.

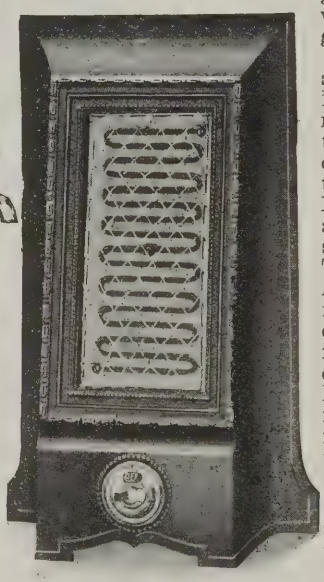

Fig. 6.—An Electric Fire.

Messrs. BELLING & Co. are making a special display of their No. 6 cookers. These have been designed specially for hiring-out purposes, and whilst the general design and constructional details are uniform throughout, three different types of heating elements are used in various combinations. The most interesting of these elements is one of entirely new design; this is of the closed type with a cast-iron top, and it is claimed to be impossible for spilt liquids to come into contact with the spiral. The design of the protecting plate enables a pint of water to be boiled from cold in 8 min. with a loading of 1,200 W. Another of the elements is of the open type, while a third incorporates the solid fireclay principle.

Two stands at the exhibition are occupied by the BRITISH ELECTRIC TRANSFORMER CO., LTD. One of these is devoted to selections of the latest "Tricity" sun-ray radiators, which are shown in something approaching a home setting, though the space available does not permit of anything like full-size rooms. On the other stand various types of cooking apparatus are shown and cooking demonstrations given. A section is set apart for general domestic electrical apparatus, including fires, toasters, irons, and kettles. The fires include models fitted with a new alternative element, in addition to the well-known "Flame" element fires. The new element is fitted with a steatite base and has spiral coils.

Messrs. D. B. SELKIRK & Co. are displaying some interesting ultra-violet apparatus, including their artificial "mountain sun" mercury-vapour lamp, some vacuum and atmospheric types of burners, and various models of arc lamps with special tungsten-cored carbons. Radiant-heat apparatus for covering the whole of the body or for local application is also being shown, and also diathermy apparatus for cauterising malignant tumours and treating certain diseases, and high-frequency equipment for the treatment of nervous disorders.

Messrs. J. H. TUCKER & Co., LTD., are devoting the space allocated to them to the demonstration of the efficiency of their new B.4,000-type 5- and 15-A switches (ELECTRICAL REVIEW, March 26th, 1926, p. 517). One switch of each capacity is controlling a load consisting of electric fires on 250 V d.c. The 15-A switch is acting as a main switch and controls two 3.3/4-kW fires, one of which is governed by the 5-A switch. The demonstration shows conclusively the exceptional high efficiency of the switches, which renders them most suitable for heating and gasfilled lamp loads.

An interesting selection of heating equipment may be seen on the stand of Messrs. YOUNG, OSMOND & YOUNG, LTD. This includes a standard skirting heater for use with the makers' electric tubular heating system. The heaters are placed horizontally on the skirting boards so as to obtain the maximum number of heat units per sq. ft. for a given surface temperature. The device is constructed with a coiled heating element passed in a hairpin bend through two porcelain tubes. The complete element is inserted in a steel tube provided with a cap at one end and a terminal cover at the other. Wall- and floor-type towel rails are also shown. With the latter no flexible wiring attachment or wall plug is necessary, a terminal being contained in the base with a length of conduit leading to it. A feature of the stand is a water-tight and gas-tight tubular heater designed for use where liquids or inflammable gases are present. Window heaters, for the prevention of water condensation on shop windows, and car-bonnet and garage heaters are also included in the exhibit.

Some interesting models of "Burco" electric wash boilers are displayed by Messrs. BURNLEY COMPONENTS, LTD. The No. 60A model has a loose lid which fits into a recess in a top rim of galvanised iron. The addition of three lugs soldered to the inside of the pan and supporting a cage or perforated container, enables this apparatus to be used for steaming vegetables or boiling puddings, &c. This boiler has a capacity of 10 gallons and a loading of 3-3½ kW. An all-copper model is also on view; the casing is of polished copper treated with a special transparent lacquer to withstand the action of water. This type of boiler is made with loadings of from 3- to 5-kW. A combination electric boiler shown is designed for boiling milk, porridge and other liquid foods, as well as for use as an ordinary wash boiler. The apparatus consists of one pan fitted inside another, the inner pan being made from hard rolled copper, tinned inside and out, and fitted with handles for lifting-out purposes. Milk is placed in the inner pan and water is poured into the outer pan by means of a funnel which is fixed on the side of the body. When the inner pan is removed, the boiler is ready for use as an ordinary wash boiler.

A range of modern domestic cookers is also being shown and operated on the stand of the CABLE ACCESSORIES CO., LTD. An all-enamelled oven is attracting a good deal of interest. It is constructed of welded-steel sections, vitreous enamelled on both sides. The lower corners at the sides and back are rounded and a lip on the front edge of the floor projects and forms a weathered joint with the casting, effectively preventing the ingress of liquids during cooking or cleaning. The oven elements are built up of refractory bars of steatite and are hung on the oven walls. A large hot cupboard is fitted with a drop door forming a shelf when open. Standard "Revotherm" semi-enclosed boiling plates are fitted on all the cookers. A new plate incorporating the "Globar" element is also being prominently shown and demonstrated. The hinged top plate is a feature of the cookers. A novel and extremely useful pot-rack is also proving of interest. It is instantly adjustable to any of six heights or at once removable. The rack and pillars as a whole are hinged and may be dropped down on to the top casting for packing or when raising the top for inspection. All the wiring is carried out in solid copper strip and all the connections to the elements are made by a standard-size nut. A selection of fires is being shown, each incorporating the "Emitter" fire bar. This is built on the parabolical-refractory-reflector system. Plug-in contacts are provided, facilitating rapid interchangeability of bars. A display of electric irons in all sizes from a 20-lb. laundry model to a small traveller's iron is also being shown.

(To be concluded.)

The Binary Converter.

A New Type of A.C.-D.C. Converter.

THE chief characteristic of the usual types of converting apparatus is that the direct-current voltage regulation depends either on the use of transformers or of two distinct machines, such as the motor-generator set. It seems, therefore that converting apparatus consisting of one machine only, capable of being arranged to be fed with alternating current of any voltage (including a high-pressure supply) without the use of transformers and, at the same time, of delivering direct current of any voltage independently of that of the alternating current, should find a wide field of application; and its value is still further enhanced by the possibility of arranging the d.c. side so as to have any desired characteristic, series, shunt, or compound, or even such special characteristics as are required for welding purposes. The type of machine described below (fig. 1) has been designed to satisfy these requirements, and is believed to possess marked advantages over every other.

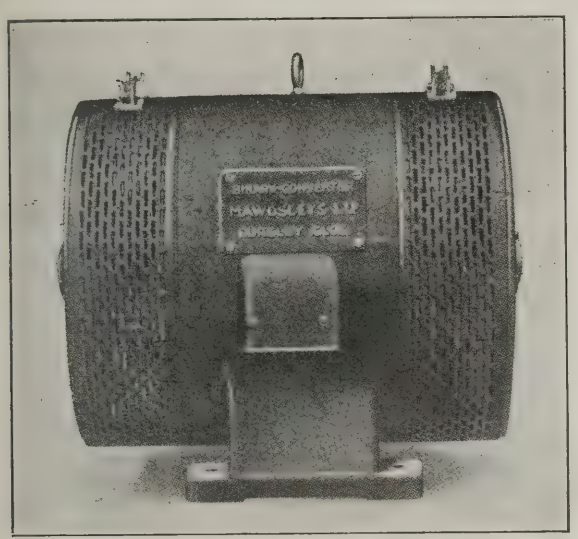

Fig. 1.—The Binary Converter.

The sectional elevation of the binary converter (fig. 3) shows that it consists of a laminated stator similar to that of an induction motor and mounted in the same way inside a cast-iron frame. The stator contains a standard induction-motor winding in the space next to the air gap, and a field winding in the same slots, but completely insulated from the alternating-current winding, there being no electrical connection whatever between them. Inside the stator a rotor carries a direct-current winding attached to a commutator; this winding is exactly the same in nearly all respects as that of a standard d.c. machine, but contains special circuits adapted to carry the secondary current of the induction-motor end; it is fitted with standard brush gear.

The binary converter may be either of the synchronous or induction type; considering the former pattern first, suppose a machine carries four windings, two on the stator and two on the rotor (*a*, *b*, *c*, d, fig. 2) and that of the rotor windings *c* is arranged for six poles and *d* is a two-pole winding; also that of the two stator windings *b* is arranged for two poles and *a* is a six-pole field winding. Suppose d.c. to circulate in the two-pole field winding *d* on the rotor and the machine to be running at the synchronous speed of this two-pole winding (namely, 3,000 r.p.m. at 50 cycles), then clearly the two-pole winding can induce no voltage in the rotor winding *c*, since it revolves with it and hence does not cut it; similarly, if d.c. circulates in the field winding *a* on the stator, it can induce no e.m.f. in the other winding *b* on the same core, since both windings are fixed. Winding *a* induces e.m.f.'s only in *c*, and *d* induces e.m.f.'s only in *b*; the flux due to winding *d* (stationary with respect to the rotor) will revolve in respect of the stator, while that due to winding *a* will revolve with respect to the rotor and is stationary with respect to the stator.

If winding *b* is supplied with 50-cycle single-phase or polyphase current, the machine will run as a synchronous motor and, if winding *c* is joined to a commutator, a direct-current e.m.f. will be produced across that commutator. Winding *d* cannot induce any e.m.f.'s in *a*, since the two are wound for dissimilar numbers of poles; for the same reason winding *c* cannot induce any e.m.f.'s in *d*.

In practice the use of two windings on the rotor of such a machine is inconvenient, and is rendered unnecessary if the single rotor winding attached to the commutator is given a pitch which is equally adapted to operate with six or two poles, such, for instance, as the full two-pole pitch which is also equally well suited to six poles. If this winding is tapped at points differing by two pole pitches of the six-pole field (that is, at three points 120 deg. apart) and the points brought out, say, to slip rings, no e.m.f.'s will be induced

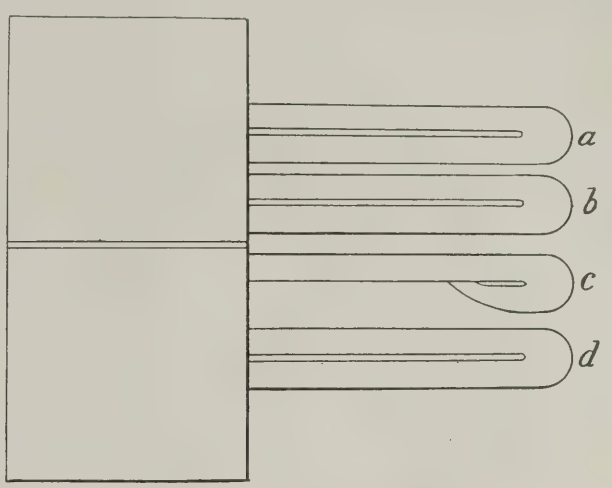

Fig. 2.—Arrangement of Windings.

by the six-pole flux between any two slip rings. If, therefore, a pair of them are short-circuited and direct current inserted between the short-circuited pair and the remaining ring, two-pole excitation of the rotor may be brought about without requiring the use of a separate winding. In this way the six-pole and two-pole windings may be combined also, but for brevity let it be assumed for the present that separate d.c. and a.c. windings are employed on the stator, as is actually most convenient in the smaller sizes.

The alternating side of the machine may also be caused to operate as an induction machine if the points which before were connected to slip rings are short-circuited. Under such circumstances currents of slip frequency will flow through the short-circuited connections and the slip rings may be eliminated. In this case, of course, the short-circuited points need not be limited to three so long as care is taken that only points two pole pitches apart of the six-pole flux are connected. This type of machine, owing to the absence of slip rings and of the necessity of d.c. excitation of the rotor, is most suitable in small sizes.

In the case of the induction machine it is no longer true

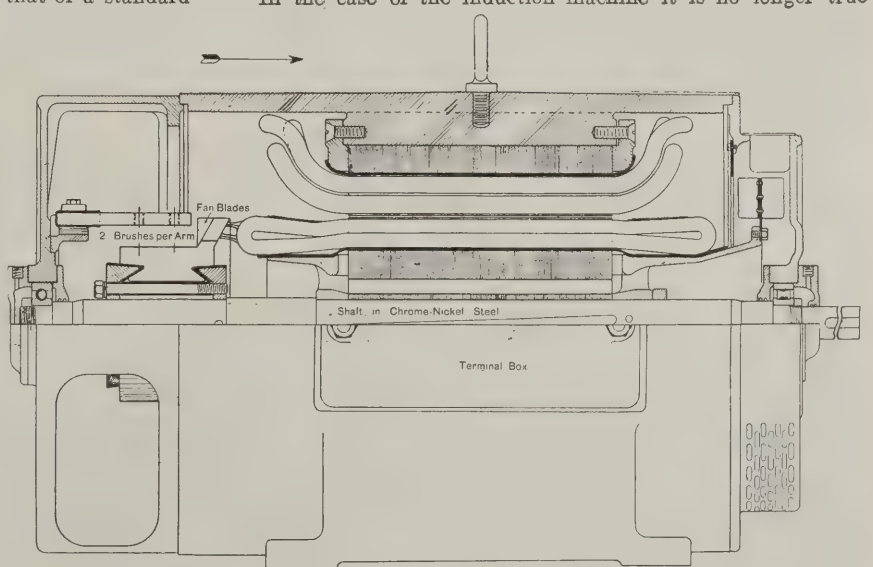

Fig. 3.—Sectional Elevation of Machine.

to say that one flux is stationary with respect to the rotor and the other with respect to the stator. The flux which is now generated by the alternating-current winding on the stator is in slow rotation with respect to the rotor also, the effect of which is to superimpose a tiny ripple (of an amplitude of perhaps one half per cent. of that of the direct-current voltage) on this voltage; the ripple is of absolutely no significance. Of course, the machine is not limited to two and six poles, but can be built for many other ratios of poles.

The practical construction of a machine of small size arranged

for two and six poles needs 24 slots in the stator, six of the slots being devoted to a shunt winding. In order to prevent the two-pole flux inducing very high e.m.f.'s in the shunt winding, which may have a very large number of turns, it is necessary to ensure that the alternating e.m.f.'s in the shunt winding shall cancel out turn by turn; for this purpose the winding is made as a single long coil, each turn passing from the first slot through the whole of the six slots before returning to the first again as is shown in fig. 4. Intermediate between any two adjacent slots of the shunt winding are three other slots. In parts of those slots next to the air gap is placed a two-pole three-phase winding of the ordinary concentric type, while in the rear of the same slot is placed the interpole winding.

in standardised sizes up to 50 kW. Fig. 5 is a curve of the full-load efficiencies of all the sizes mentioned plotted against kW rating, and other advantages claimed for this type of machine include the following: No slip-rings are needed, synchronising is unnecessary, high power factor, transformers never required, effective on single-phase circuits, can be made to run at any speed independently of the number of poles on the d.c. side, and its efficiency is about equal to that of a rotary converter of moderate size. It will thus be appreciated that the characteristics of the binary machine closely resemble those of a motor-generator, excelling chiefly over the latter by virtue of greater compactness, lighter weight, and higher efficiency, together with moderate cost.

Applications of the binary converter are many and diverse,

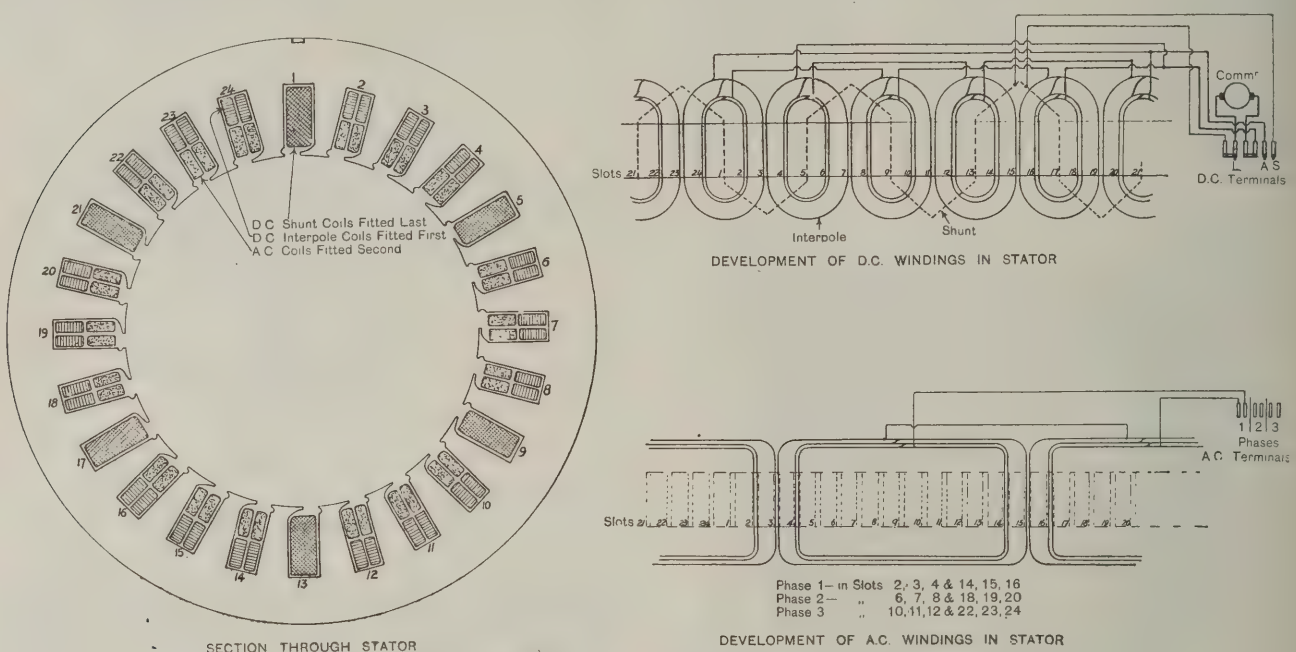

Fig. 4.—Binary Converter Stator Winding Diagram.

The rotor consists of a d.c. armature of a perfectly normal type, corresponding to that of a two-pole machine, and short-circuited along a number of points (each two pole pitches apart) of the d.c. winding. Such a machine, in essence, consists of an induction motor driving a direct-current generator, both having common magnetic circuits and common windings. On the d.c. side it has all the characteristics of the d.c. interpole generator, *i.e.*, it can be compounded by moving the brushes off neutral, the d.c. voltage can be regulated by a field rheostat in the usual manner, and it can be started in the same way as a squirrel-cage induction motor, not requiring synchronisation.

The starting gear of the binary converter is that appropriate to a squirrel-cage induction motor. The smallest size of converter may be switched directly on to the line; for sizes of from 1 to 5 kW star-delta starters are employed, while

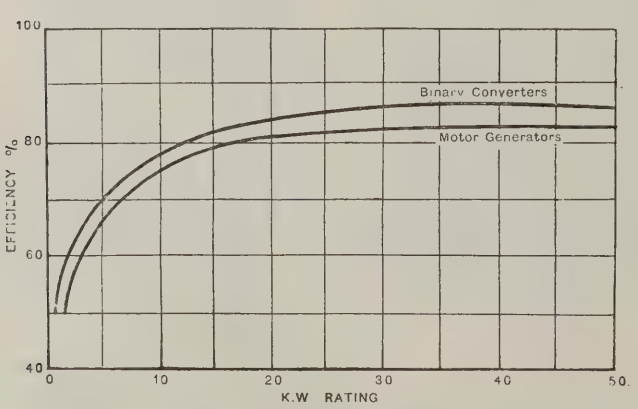

Fig. 5.—Efficiency Curves.

for larger sizes either an auto-transformer starter may be employed or a type which has been specially designed for the purpose; the latter, in the starting position, inserts a choke in series with the line in order to cut down the voltage supplied to the motor, and in the running position connects the terminals of the motor directly to line. It should be pointed out that the binary converter always starts on absolutely no load, and only has to accelerate its own rotor against the friction of the brushes. It is therefore possible to reduce the starting current of a squirrel-cage motor to a very low figure, not exceeding twice full-load current; or, when an auto-transformer starter is used, one and a half times full-load current.

Binary converters are being built under Mr. F. Creedy's patents and placed on the market by Messrs. Maudsley's, Ltd., of course, and special applications include the possibility of obtaining Ward-Leonard control with a "single-unit" set. The converter could be mounted with a suitable small exciter and d.c. motor on a common bedplate, or the motor might be separately located, and the complete combination requires no more space than does a d.c. motor with worm gear and pony motor, so often used for driving a printing press at inching speeds for example. At the same time, the binary arrangement eliminates the elaborate control frequently required, since a Ward-Leonard unit is controlled entirely by means of field rheostats, as shown in fig. 6, in which the

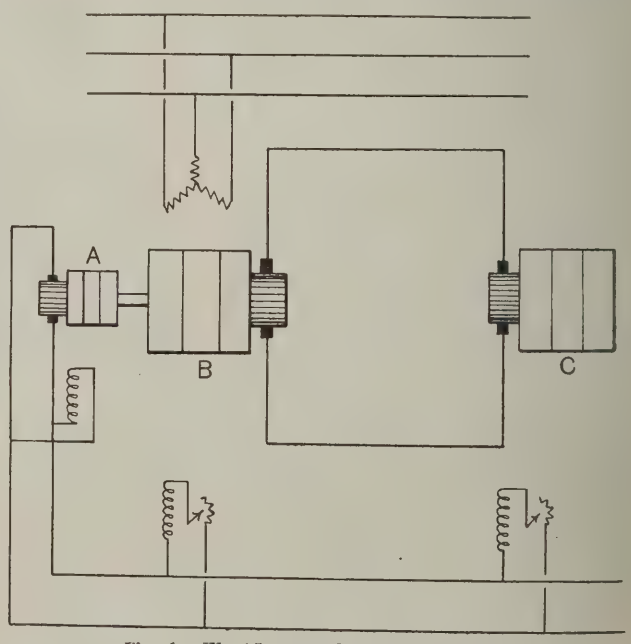

Fig. 6.—Ward-Leonard Control Arrangement.

exciter A (which is required for such applications so that voltage regulation at the binary commutator may not vary the voltage across the motor field) is shown mounted on a common shaft with the binary B; it excites the two fields of the binary and motor C in parallel, the commutators of the two machines being permanently coupled together. For printing press work the two field rheostats are operated by a small auxiliary motor which first cuts out the resistances in the converter circuit, thereby raising its voltage to the

maximum, and next weakens the field of the motor to obtain still higher speeds. The auxiliary motor which operates these field rheostats is controlled by push buttons mounted on various parts of the press in the usual manner.

For certain purposes the motor has to run at not more than 3 per cent. of its maximum speed, the total speed range, therefore, being 33 to 1; by means of the arrangement just described this very wide speed range can, it is stated, be easily accomplished. Where such extreme speed ranges are not required regulation of the strength of the motor field may often be omitted, the whole of the control being effected by means of the converter. Moreover, since the binary converter can be accurately compounded, very close speed regulation with increasing loads can be obtained. Automatic control as applied to the binary is claimed to represent considerable simplification, and steps are being taken in conjunction with control-gear specialists to adapt standard methods of automatic control for sub-station purposes.

For arc-welding the advantages of the binary converter are chiefly that a short circuit on the d.c. side does not mean a short circuit on the a.c. side, as there is no electrical connection between the two, and the independence of the voltages renders it possible to design the d.c. side with the required drooping-voltage characteristic.

A New Type of Boiling Plate.

An I.M.E.A. Exhibit.

One of the exhibits which is attracting a great deal of attention at the I.M.E.A. Exhibition at Glasgow this week is a new type of boiling plate shown by Metro-Vick Supplies, Ltd. This new "Cosmos" product is of the totally-enclosed type and has some unusual design features, being based on the invention of Mr. Christian Bergh Backer of an entirely new method of manufacturing electric heating elements, a new insulating material being produced in the process. The insulating substance consists of crystalline magnesium oxide (or hydroxide), made by treating pure magnesium metal in steam under high pressure, or alternatively in water under high pressure and at raised temperature. The crystalline magnesium hydroxide and oxide so obtained have been found to be fairly good heat conductors, whereas in any other form the material is a very bad conductor of heat. It is also known to be of the best of electrical insulators at high temperatures, and the combined properties have proved of great value in the new boiling plate elements.

Experiments on the production of heating elements for such as boiling plates for kitchen ranges, were started by the inventor of the process at the beginning of the year 1921, and the results soon proved that the new magnesium oxide was far superior to anything previously tried out as an insulating medium in electric boiling plates. The plate itself is of a special heat-resisting cast-iron, on the underside of which is a cast groove running in a spiral from the centre of the plate to the edge, fig. 1. Into this groove is placed a flexible magnesium-metal "tube" which has the coiled-up resistance wire inside it. The outside diameter of a magnesium "tube" is such that the tube fits tightly into the groove in the cast-iron plate, fig. 2. The plate is now placed in an autoclave and treated with steam, whereby the magnesium metal "tube" is converted into a similar "tube" of crystalline magnesium hydroxide. During the conversion the material grows or expands, so that the insulation becomes about twice as thick as the metal was before conversion, fig. 3. This expansion of the oxide is a very important attribute, as the coil of resistance wire thereby becomes completely embedded in the oxide, and is not only held firmly in place, but intimate thermal contact is assured. After the oxidising process is completed, the spaces in the grooves are filled with alumdum cement; a thin mixture is used, so that it runs easily down into all the openings and fills out the groove in the cast-iron plate completely. Whilst the cement is wet, an asbestos disk is placed over the coil and the element is finished off with a cast-iron press plate held in place by a screw in the centre, fig. 4. The insulation as yet is magnesium hydroxide (not oxide), as the temperature must be raised to over 300 deg. C. in order to drive off the "hydroxide water." Once the plate has once been dried out, any moisture which may enter it subsequently, either by soaking or by leaving it for several weeks in extremely damp air, is easily driven off by switching on the current for a few minutes. The actual wire used has been chosen as the result of exhaustive tests which have been carried out by the Metro-Vick Research Department on the behaviour of resistance wires at widely different temperatures. One very important characteristic of crystalline magnesium oxide is its elasticity. It has been found that after several thousand hours' use the formation of the oxide crystals is exactly the same as it was immediately after conversion from the magnesium metal, which supports the claim that this form of oxide positively does not break up into powder. The result is that the wire always remains compactly embedded, and the "breathing" of the wire during heating and cooling is amply taken care of by the elasticity of the magnesium oxide.

The "Cosmos" 8 5/16-in. diameter boiling plate of 2,000 W loading will reach the maximum temperature of about 600 deg. C., that is, red hot, if left uncovered by a utensil. This plate, it is claimed, will stand running red hot for years without burning out the resistance wire, because the wire itself, even with this extremely high loading, never comes up to a higher temperature than about 750 deg. C., at which heat the best grades of nickel-chromium wire will stand indefinitely in any elements where air for all practical purposes cannot get in contact with the wire.

The high loading permissible on these plates is only made possible owing to the comparatively high thermal conductivity of the crystalline magnesium oxide, and also on account of the fact that the element is embedded in the cast-iron itself so that the heat generated in the coil has a free and uninterrupted path through the oxide to the surface of the plate.

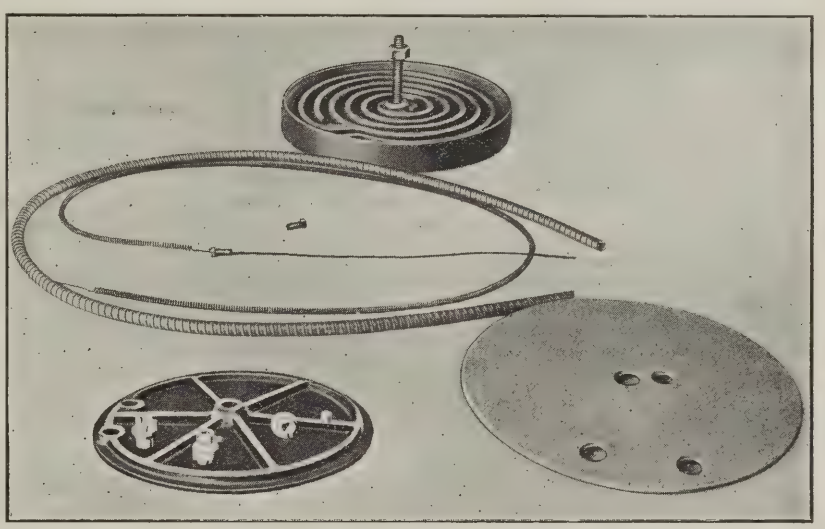

Fig. 1.—Boiling-plate Parts, Unassembled.

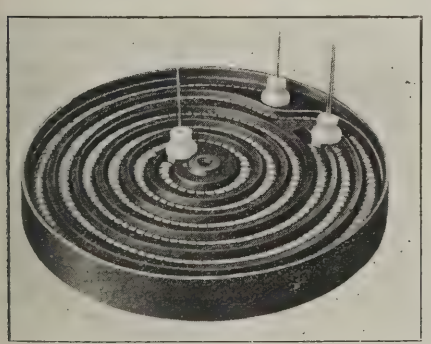

Fig. 2.—Magnesium Tube Before Oxidisation.

Fig. 3.—Tube After Conversion.

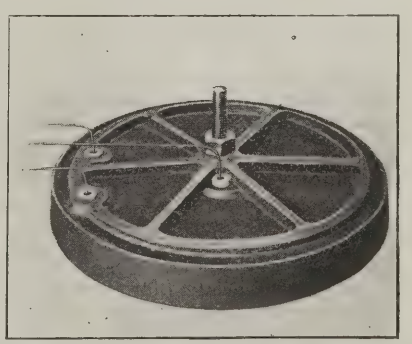

Fig. 4.—Complete Boiling Plate.

The following figures which have been obtained during tests by the National Physical Laboratory regarding the operation and serviceability of this boiling plate, add to the interest of these particulars. Two pints of water were brought to the boil from 60 deg. F. in 8.5 min. on a consumption of 285 Wh; three pints in 10.75 min. on 360 Wh; four pints in 13 min. on 435 Wh; and five pints in 15 min. on 505 Wh.

The smaller quantities of water were boiled in a cast-aluminium kettle with a machined bottom measuring 8 in. in diameter, and weighing 1 lb. 12½ ozs. The larger quantities were boiled in a cast-aluminium saucepan with a machined bottom measuring 7⅞ in. in diameter, 4¾ in. high, weighing 3 lb. 8½ oz. It is claimed that after the plate has been on circuit for from five to ten minutes, its efficiency approaches 90 per cent.

The boiling plates are at present made in two sizes, 8½ in. and 6½ in., with loadings of 2,000 and 1,200 watts respectively for 100-250 volts.

The process above described is in no way restricted to the manufacture of boiling plates; it is claimed that it can be utilised for all types of heating elements in use at the present time and we look forward to developments in this direction with interest.

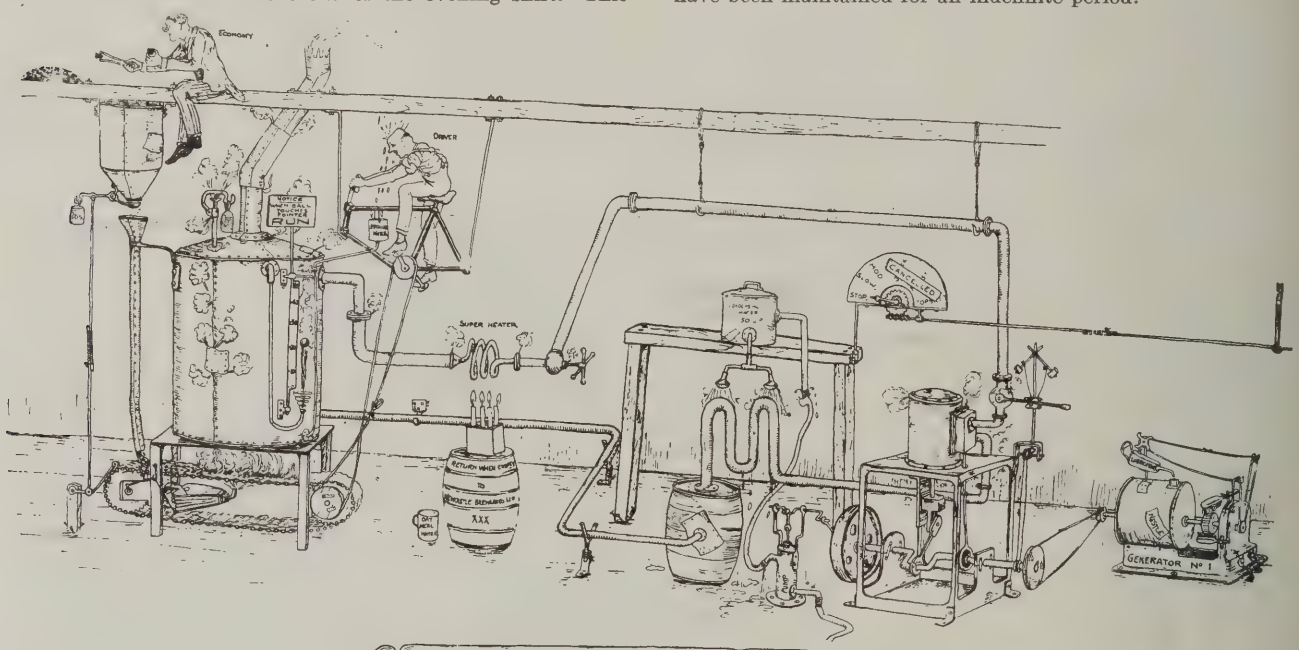
An Electricity-Supply Emergency Organisation.

Measures Adopted by the North-East Coast Supply Companies During the General Strike.

The following particulars have reached us concerning the position of the North-East Coast Power Companies during the general strike. On May 6th official notice was received by the Newcastle-upon-Tyne Electric Supply Co., Ltd., and its Associated Companies, that certain grades of their employés would be called out on strike at the end of the evening shift. This notice affected 889 men, of whom a certain number were engaged in such duties as construction work, which automatically came to an end in the time of emergency. It was only necessary to replace those strikers who were engaged at the three main coal-fired generating stations and the sub-stations. In an extremely short time arrangements were made to draft a large number of emergency workers into these parts of the system, 281 of whom were members of the staffs of the companies or their consulting engineers, Messrs. Merz & McLellan, and were mainly drawn from the technical and clerical personnel.

The number was made up by the addition of many outside volunteers, including a number from local engineering or electrical works, or contractors. Others were supplied by the Armstrong college union or the local voluntary-service organisation. Many offers of help were received from firms or individuals in the district, which the companies had regretfully to decline.

The task was by no means completed with the replacement of the industrial staff; it was found necessary that the emergency workers in the various stations should be housed on the premises, and a welfare organisation was formed to provide sleeping accommodation for all who were confined to the power stations, and to cater for about 700 workers. At the Carville station a temporary hut was available, and in this and the offices 147 men were housed. At the Dunston and North Tees stations there were no buildings which could be used for sleeping purposes, but the London and North-Eastern Railway Company provided a train of seven coaches at each power house, which made very comfortable sleeping quarters. In addition to the main power stations, there were 18 rotary sub-stations which had to be permanently manned. One man per shift was drawn from the technical staff and two non-technical men on each shift were obtained from the volunteers to be available for any emergency which might arise.



Under a chief welfare officer at the head office, an officer was allocated to each station, who was responsible for all the arrangements for accommodation and catering. At the North Tees power station and the garage cooking was done entirely by electricity, while at the other two generating stations army field kitchens were used. To keep the staff at the various stations in touch with the activities of the company, a news bulletin, "Nesco News," was issued daily.

The transport work was done wholly by volunteers, who were drawn mainly from the existing staff of the company, with the addition of a few helpers from outside.

Transport officers were appointed, who were on duty night and day, and a certain number of the emergency transport workers slept on the premises. Some idea of the amount of work done by the transport organisation during the emergency period may be gathered by the fact that the 80 cars and 12 lorries employed covered over 30,000 miles. The work included the transport of members of the clerical staff to and from their work; many of them living ten to fifteen miles from their offices.

In addition to road transport, a considerable amount of work was done on the River Tyne. A prominent shipbuilding company placed a launch and crew at the companies' disposal, which was available night and day for transporting men and material between the Dunston and Carville stations and Newcastle. By this means laundry work, letters, parcels and the amenities of life were dealt with.

The result of the work done by the emergency organisation was that no single consumer in the companies' territory of 1,400 square miles was subject to any interruption of supply as the result of the general strike. The organisation which was, of course, at the first rough and ready, daily became more perfect, and there is little doubt that supplies could have been maintained for an indefinite period.

THE VOLUNTEER'S DREAM.

The accompanying illustration, an effort by Mr. Collingwood, of the Newcastle-upon-Tyne Electric Supply Co., Ltd., represents his idea of the impressions of the inner working of the generating station on the mind of the "volunteer."

Investment and Production in the United States.—In the course of an address delivered at the recent annual convention of the National Electric Light Association, Mr. Samuel Insull, president of the Commonwealth Edison Co., said that sales of electrical energy in the United States lagged behind the increasing investment in plant and equipment and were not keeping pace with the increase in generating capacity. It was satisfactory to see that the reduction of the cost per kW of plant by improved methods of generating electricity had resulted in the average investment being reduced from $425 per kW in 1912 to $294 per kW in 1923. It would naturally be concluded from this that the number of kWh generated per dollar invested had automatically increased. From 1912 to 1923 that was true, the number was nearly doubled. In 1924, however, the figure fell from 10,000 kWh per dollar invested to 9,450 kWh, and in 1925 there was a further decline of 9,300, a fall of 7 per cent. in two years. When the relation of generated energy to plant capacity was considered the unsatisfactory position was accentuated. In 1912 the average number of kWh generated per kW of capacity was 2,240. By 1917 it had risen to 2,820 and it remained at about this level until 1923, when it fell to 2,450, receding further to 2,410 in 1924. There was a slight improvement in 1925, when a figure of 2,440 kWh per kW was reached. Mr. Insull deduced from those figures that the supply industry of the United States, on the whole, was not expanding and increasing its business as fast as it should.

The Electricity (Supply) Bill.

The Proceedings in Committee.

(*Continued from page* 888.)

STANDING Committee C of the House of Commons resumed consideration of the Electricity (Supply) Bill on June 7th, the Committee having decided to sit on two or more afternoons in each week in order to facilitate the progress of the Bill.

Sub-section (2) of Clause 2 enables the Central Electricity Board to delegate powers to "any authorised undertakers or other bodies." Mr. ATTLEE (Limehouse, Lab.) proposed to leave out the words "or other bodies" and to insert instead the words "being a local authority or group of local authorities." He explained that the Board might at any time, without the consent of the Electricity Commissioners, delegate its powers to any authorised undertakers or other bodies, to be exercised by such bodies on behalf of the Board. The Labour party was desirous of maintaining public control. There was nothing in the clause, as it stood, to prevent the Board, if it so wished, from delegating, for instance, the whole of its powers in the Yorkshire area to the Yorkshire Electric Power Co., although probably some of the local authorities would have something to say in that case. The Labour party said that if there was to be delegation, it should only be to public authorities.

Sir DOUGLAS HOGG, the Attorney-General, in resisting the amendment, said that if the Committee was going to set up a Board and give it powers of delegation, it should trust the Board to exercise those powers reasonably. He was always in favour of delegation, in proper instances, being entrusted to local authorities; but equally, in proper instances, when the authorised undertakers were in fact private companies, he saw no reason why the same power of delegation should not be exercised. The effect of the amendment would be that, when an undertaker was a private company, there would be no power to delegate to it any powers, though exactly similar powers in an adjoining area, where the local authority was the authorised undertaker, would be delegated to that local authority. That was not a reasonable proposal.

Sir JOSEPH NALL (Manchester, Hulme, U.) suggested that the Committee should delete the words "or other bodies," but should not insert the words "being a local authority or groups of local authorities." He said that, wherever the Board proposed to delegate its powers, it ought to do so to the authorised undertaker in that district.

Mr. G. BALFOUR (Hampstead, U.) supported this view, which was eventually adopted by the Committee. The words "other bodies" were deleted from the clause, but the substitution for them of the words "being a local authority or group of local authorities" was negatived by 40 votes to 11.

Mr. ATTLEE then moved the insertion of the following new sub-section:—"(3) The Board shall, with twelve months from the date of this Act, or such later date as may be approved by the Electricity Commissioners, submit to the Electricity Commissioners a scheme providing that in the district of any joint electricity authority or other body formed under the provisions of Section 6 of the Electricity Supply Act, 1919, and any Act amending the said Act, all the powers and duties imposed upon and entrusted to the Board under this Act shall be exercised on behalf of the Board by such joint electricity authority or other body, and any such scheme shall contain provisions enabling the Board to resume the exercise of its powers and duties in such district or districts in default of such joint electricity authority or other body." He said that the amendment was a mandatory one, directing the Board to make a scheme for delegation in certain definite areas.

Lt.-Col. MOORE-BRABAZON, Parliamentary Secretary to the Ministry of Transport, opposed the amendment, which, he said, would be almost a breach of faith with regard to past legislation. The amendment was negatived by 28 votes to 10, and Clause 2 was then added to the Bill.

Clause 3 provides: "(1) that the Board shall appoint one or more consultative technical committees consisting of engineers employed in connection with generating stations which are by virtue of this Act for the time being selected stations; and that (2) a consultative technical committee shall give advice and assistance on such matters as may be referred to the committee by the Board, and for that purpose the Committee shall meet from time to time as the Board may determine." An amendment to substitute the Electricity Commissioners for the Board was negatived, but a further amendment, moved by Mr. CLAYTON (Widnes, U.) to make it optional instead of mandatory on the Board to appoint committees of technical engineers was accepted by the Government and agreed to.

The Committee then adjourned.

On the resumption of the proceedings on June 8th, Sir D. HOGG moved an amendment to insert after the word "with" in sub-section 1 the words "undertakings owning." He said that the clause provided for the appointment of consultative technical committees, consisting of engineers employed in connection with generating stations, but sometimes a chief engineer of a large undertaking might not be actually employed in connection with the particular generating station which had become a selected station, and it would not be desirable to make him ineligible for the Committee; hence the amendment, which was agreed to.

On the motion that the clause stand part of the Bill, Mr. G. BALFOUR opposed the clause, as Clause 1 was quite wide enough to provide the Board with all the technical consultative assistance that was required.

After further discussion the clause was added to the Bill.

Clause 4 makes it the duty of the Board to submit a scheme to the Electricity Commissioners. Mr. R. HUDSON (Whitehaven, U.) moved an amendment to provide that the Commissioners should prepare and submit a scheme to the Board, explaining that this and other amendments which he proposed to move carried out a suggestion which he made earlier in the Committee's discussions. The Board would hear all objections and afterwards publish the scheme, which would be, in essence, a considered judgment by an impartial tribunal, as it were a court of appeal. After that, an impartial appeal tribunal would be set up to consider the case of anyone who felt that his interests were unreasonably affected, the only proviso being that no alterations in the fundamental principles of the scheme might be made by any decision of that appeal tribunal.

Sir D. HOGG, without pledging himself to the exact wording of the amendment, said that the view of the Government was that Mr. Hudson's scheme was a reasonable and fair one. It met the difficulty which the Government had felt of increasing cost and delay so much as to render the scheme financially impracticable. Therefore, the Government proposed substantially the scheme that Mr. Hudson had put forward.

Mr. ATTLEE opposed the amendment, saying it would involve the complete remodelling of the Bill and the practical abolition of the Commissioners.

Sir J. NALL said that the new proposal would result in prolonged delay. For how long was development to be held up owing to uncertainty about the present Bill?

Mr. HARDIE (Glasgow, Springburn, Lab.), who opposed the amendment, declared that the Bill was being forged to protect private interests.

Sir C. WILSON thought the best thing was to take the Bill back and recast it, for it was quite unworkable.

Sir D. HOGG said that if the Bill was passed by the end of next month the Commissioners hoped that schemes for certain areas would be submitted to the Board before the end of the year, and, if all went well, he saw no reason to doubt that those schemes might actually become operative in the early part of next year. He hoped the Bill would receive the Royal Assent by the end of July.

Mr. Hudson's amendment was carried by 29 votes to 13.

Mr. GRANT (Derby, U.) moved to insert after the words "that the Electricity Commissioners shall prepare and submit to the Board a scheme," the following:—"or schemes relating to the respective areas specified therein."

Sir D. HOGG agreed that there must be schemes for different areas, but there must ultimately be one scheme for the whole country, of which each separate area would form a coherent part.

The amendment was carried by 38 votes to 18.

Mr. CLAYTON (Widnes, U.) moved an amendment to make it feasible for the Board to leave the construction of the transmission lines to independent parties, because the scheme would work very much better if it were split up into areas. He was no believer in the "national grid"; he wanted the different areas to be linked one with the other, but would like the areas to be worked independently, because, although 50-cycle alternating current was the best method of generating and transmitting at the moment, it did not necessarily follow that it would always remain so. It was a false step to stereotype for the whole country, and it would be very much better if each large area (the country might be divided into six or 80 divisions) were left to work out its own method of generation and supply; they could be linked, and the amount of electricity that was likely to pass from one area to another would be only a small proportion of the energy generated. There was no particular reason why Newcastle with 40 cycles should be altered to 50; Birmingham believed that 25 cycles suited its requirements; it was possible that the generation and transmission at high voltage by direct current might also prove a success.

Lt.-Col. MOORE-BRABAZON said that one of the fundamental principles of the Bill was that the Board should retain power to acquire and maintain such lines as it wished.

The amendment was withdrawn, and the Committee adjourned.

The proceedings were resumed on June 10th, when discussion was continued on Clause 4.

Sir D. NEWTON (Cambridge, U.) moved that the standard frequency should "ultimately be the same throughout the country." Personally, he was doubtful whether the standardisation of frequency could ever be obtained.

Lt.-Col. MOORE-BRABAZON, while sympathising with the object of the amendment, pointed out that the frequency was only to be changed when it could be clearly shown that from the point of view of pounds, shillings, and pence there was an advantage to change it to 50 cycles, *i.e.*, when there was a "spilling over" of current from one to another area. With

regard to the railways, they used direct current which was from 25-cycle a.c. If they were to be compelled to change in every case from 25 cycles to 50, their plant and plans would be dislocated.

Mr. G. BALFOUR declared that the railway services were entirely independent of the standardisation of frequency.

After some discussion, in the course of which it was pointed out that the general debate on the question of standardisation of frequency would come on Clause 9, the amendment was withdrawn.

Sir J. NALL moved that the period of the temporary arrangements to be made between the Board and the owners of generating stations with respect to the giving and taking of to and by the Board of supplies of electricity, &c., should be limited to the period of carrying out of the works specified in the scheme, was accepted by the Government and agreed to.

A further amendment, moved by Mr. R. HUDSON, to leave out the proviso that the temporary arrangements should be based "upon such terms as in default of agreement may be determined by the Electricity Commissioners" was also accepted by Sir D. Hogg, and agreed to.

Sir D. Hogg accepted an amendment, moved by Mr. FIELDEN (Manchester, Exchange, U.) to provide that generating stations operated by railway companies at the date of the passing of the Act should not be chosen as "selected stations." Sir D. HOGG pointed out that the railways at present were not coming into the scheme. They used direct current, and their generating stations were, therefore, not required under the scheme. The railway companies' request to be specially excluded was not unreasonable, and the Government had acceded to it.

Another amendment was agreed to exempting generating stations owned by dock authorities from being "selected stations."

Lt.-Col. MOORE-BRABAZON resisted an amendment, moved by Sir J. Nall, asking for an inquiry to be held by the Board if representations were made to it after the publishing of the scheme. After some debate, the Attorney-General undertook to move an amendment to give power to the Central Board to hear parties if it thought fit, and on this understanding Sir J. Nall withdrew his amendment. Later, the Attorney-General's amendment was agreed to.

Mr. CLARRY (Newport, U.) said that the gas industry was desirous of co-operating with the electrical industry through the Bill, primarily with regard to the selection of sites and the formation of schemes with regard to fuel, and at a later stage with regard to distribution.

Sir D. HOGG welcomed this statement, seeing in it an opportunity properly to co-ordinate the country's fuel resources.

The Committee adjourned.

(To be continued.)

Italy's Electrical Trade.

THE following statement, showing the imports into and exports from Italy of electrical goods during 1925 has been compiled from the recently-issued official trade statistics. The figures for 1924 are added for purposes of comparison and notes of any increases or decreases are made:—

IMPORTS.

	1924. Quintals.	1925. Quintals.	Inc. or dec. Quintals.
Electric generators and motors—			
Total	17,000	24,000	+ 7,000
From Austria	700	1,400	+ 700
,, Germany	6,200	12,000	+ 5,800
,, Great Britain	270	800	+ 530
,, Hungary	2,700	4,500	+ 1,800
,, United States	2,000	650	− 1,350
Static transformers—			
Total	6,700	11,000	+ 4,300
From Austria	200	500	+ 300

Legal.

British Thomson-Houston Co., Ltd., v. Siderman.

MR. JUSTICE TOMLIN, in the Chancery Division on June 8th, gave judgment for the British Thomson-Houston Co., Ltd., against L. Siderman, in an action for an injunction restraining infringement of the plaintiffs' patents for gasfilled electric incandescent lamps and leading-in wires, in default of defence.

This was the case in which the importance was urged of granting injunctions *ex parte* owing to the difficulty of stopping the importation and sale of lamps infringing the plaintiffs' patents. Counsel now said that that action was started against three defendants, Wood, Siderman and a company owning the wharf to which the lamps were traced, but the action was discontinued against the company upon hearing their evidence. Both patents had been held to be valid.

Fellows Magneto Co., Ltd., v. E. H. Druce & Co.

MR. JUSTICE MACKINNON, in the King's Bench Division on June 11th, had before him an action brought by the plaintiffs to recover the sum of £425, balance of account for a quantity of machinery and plant sold to E. H. Druce and Company, Coventry. Mr. H. D. Samuels was for the plaintiffs and Mr. J. F. Eales for the defendants.

Opening the case for the plaintiffs, Counsel stated that in July, 1925, his clients made a contract orally that defendants should purchase machinery from them, which consisted of a number of lathes, screw slotters, and milling machines, at a price of £1,235. That contract was confirmed by invoices and it was part of the contract that the payments were to be made at once and that the goods were not to be removed from the plaintiffs' works before payment. In July defendants paid £850 and removed part of the goods. Defendants' case was that the contract was not completed inasmuch as the machines were not complete and were lacking equipment; that prevented the defendants from again selling at a profit and as a result they counterclaimed for £314.

His LORDSHIP held that the defendants' view of the contract was the right one, and entered judgment for the defendants on the claim and the counterclaim with costs.

Electrical Companies and Directors Fined.

THE *Birmingham Post* reports that at the Birmingham Police Court, on June 9th, the Stipendiary (Lord Ilkeston) inflicted fines of £20 and five guineas costs in each case on the Warwickshire and South Midland Electricity Supply Corporation, Ltd., and the Electric Light and Power Contracts Finance Corporation, Ltd., for failing to file their annual summaries

of account at Somerset House. The following directors were fined £20 for permitting the default, except in the case of Bridgen, who only joined the board of the Electric Light and Power Company at the end of last year, the fine in his case being £10. Of the Warwickshire Corporation: Wilfred Burton, London; Emerton Claude Buik, Dulwich; Walter Thompson, West Hampstead; and Edward Bennett Calvert, London. Of the Electric Light and Power Company: Sir Charles B. Hearne Soame, Bart., Coalbrookdale, Salop; James Bridgen, London; Christian Ernest Paul Groth, Soho, London; Eliot Foley Hill, London.

Mr. E. W. TUNBRIDGE, on behalf of the Board of Trade, said the Warwickshire Company filed a return up to March, 1924, but nothing further in the way of an annual return was forthcoming from it until a few days ago, after the summons was issued. With regard to the Electric Light Corporation, no annual summary was filed until June 4th this year, though the company was incorporated on April 16th, 1924. The summary then submitted had been accepted and filed.

For the defence Mr. HAROLD ELWELL stated that all the directors of the two companies were present with the exception of Mr. Hill, who had communicated with the Court, and Sir Charles Soame, who had sent a medical certificate. The directors accepted responsibility and had instructed him to say that the omissions arose through a dispute with a firm of accountants employed to keep the books. Further, Mr. Alan Eaden, who was secretary of both companies, died in September last year. ROBERT PAUL HARLEY, the new secretary to both companies, said that when he took over in September last the accounts were in a chaotic state, and he had had considerable difficulty in making up the accounts.

Alleged Mercurial Poisoning.

THE judgment of his Honour Judge Ruegg, was read by Judge Dobb at the Birmingham County Court on June 9th, in a case under the Workmen's Compensation Act. The point at issue was whether the workman died from mercurial poisoning or natural causes. The claim of the widow was heard in April by Judge Ruegg, who sat with a medical assessor (*vide* ELEC. REV., May 7th, p. 762). The deceased man, named Richard Goffe, was a meter inspector in the employ of the Birmingham Electric Supply Department, and the plaintiff was his widow, Lucy Goffe. The amount of the claim, £520, was not disputed by the Corporation, but it was held that the death was due not to mercurial poisoning, as the plaintiff submitted, but to an obscure germ.

Judge RUEGG held that, although he accepted the evidence that death was due to myelitis, he thought that deceased would not have died but for mercurial poisoning. The germ was one which attacked people of low vitality. Judgment was accordingly given for plaintiff.

Stepney Ratepayers and Electricity Stoppage.

THE *Daily Telegraph* reports that a case arising out of the general strike was heard at the Town Hall, St. Georges-in-the East, on June 10th, when Messrs. Buck & Hickman were summoned in respect of the non-payment of a portion of the general district rate. The Town Clerk (Mr. V. B. Bateson) represented the Stepney Borough Council, and Mr. T. J. O'Connor appeared for the defendants.

Mr. O'CONNOR said that the defendants had never previously refused to meet their due obligations in the matter of rates, and they desired to have the reasons stated why they now refused to pay. By criminal conspiracy to control the supply of electricity for a political purpose the Borough Council deprived them unlawfully of electricity supply from May 3rd to May 12th. The supply was only restored on May 13th, the day before the general strike ended.

Mr. BATESON said that that was an allegation of a serious character, and was absolutely groundless.

Mr. O'CONNOR quoted a section of the Electric Lighting Confirmation Order to show that the Council was liable to penalties, except where failure to supply was due to accident or *force majeure*, and said that as a result of the failure to supply sixty-five men were thrown out of work, the firm being deprived of power. There was no *force majeure* because the Electricity Commissioners had broadcast a notice that they were prepared to supply volunteer labour to carry on such undertakings wherever required. The Council took no steps to avail itself of this offer, but used its position wrongfully to prevent his clients "obtaining money with which to pay the rates, which I say is action of a criminal character against a law-abiding firm."

Mr. BATESON protested. Every statement made, he said, was a misrepresentation.

The CHAIRMAN, after consultation, said there would be an order for the payment of the rates, which could be paid under protest, and the defendants could take any action they pleased after that.

Gilbert Gilkes & Co., Ltd., v. Marshall.

BEFORE Mr. Justice Talbot, on June 8th, at the Lancaster Assizes, Messrs. Gilbert Gilkes & Co., electrical engineers, Kendal, sued Mrs. E. E. Marshall, Keswick, to recover £126 7s. It was stated that there was a contract for renewing and recharging the cells of the battery in defendants' power house, and the plaintiffs' electrician did the work in March, 1925. After the electrician had left the premises a fire broke out and destroyed the power house. Defendant received £250 from an insurance company, but denied liability to pay Messrs. Gilkes because they had not handed over the job and their workman had been negligent in leaving the door of the power house locked when he knew that dangerous gases came from the charging of new accumulators.

Expert evidence was given for the defence on June 9th by Mr. JULIUS FRITH, M.Sc., M.I.E.E., who expressed the opinion that the fire originated in the battery room, where there was a collection of hydrogen, through the place being closed immediately after the charging current was switched off. A spark might have come from a short circuit between the wires from the cells and the switchboard. Cross-examined, he said that a skilled workman would have left the windows open. At the end of a long charge the dangerous condition was more pronounced through leakage or bad connections at the terminals, especially when old wires were used. Witness thought the fire occurred either through a spark or from the ignition of the inflammable covering of the cables.

Mr. H. BAWN, an electrician, said he had frequently charged the old batteries, and always left the window open to let out gases from the wooden building. There was always danger from leakage in battery rooms.

Mr. W. M. HARRISS, A.M.I.C.E., director of Gilbert Gilkes and Co., said that it was quite safe to use old wires. Any deterioration in insulation would have been evident during the charging period.

Mr. P. H. BAILEY, electrical engineer, said he had never heard of an explosion in a battery house due to hydrogen collecting after the charging ceased.

Mr. DERBYSHIRE, for defendant, said that they had been asked to pay for work before it was done, because it was destroyed. The plant had run 11 years and the presumption was that the plaintiffs' electrician had been negligent in leaving the place.

His LORDSHIP said that while he believed the goods were ordered, he did not think the plaintiffs were entitled to be paid for labour.

He found for the plaintiffs for £109 4s. 2d., and dismissed a counter-claim by the defendant.

Correspondence.

Earth Tubes for Radio Sets.

Regarding the discussion on radio earths in your columns, the following may be of some little interest.

For experiment, two other earths were tested against the water-pipe earth which is regularly used with my broadcast receiver. One was a buried earth consisting of a piece of galvanised iron sheet put down about two feet six inches, the other a well-known make of copper earth tube.

A crystal set was used, which had a micro-ammeter in series with the crystal. The following readings were obtained on Daventry (100 m.) and 2ZY (45 miles), at the same setting of the crystal:—

	Water Pipe.	*Buried Plate.*	*Tube.*
Daventry	70	70	65
2ZY	51	40	22

The figures relate to scale divisions, 23 of which equal one micro-ampere. In all other tests the figures have been of the same order, although their proportions have varied somewhat. My conclusions are that with the 1,600-metre wave a fairly good buried earth will almost equal the water pipe, but on 378 metres there is a very marked difference in favour of the water pipe, the tube showing up poorly.

The micro-ammeter mentioned was home-built at the cost of a few shillings and a lot of patience, but its infinite usefulness in attacking problems like the above has justified all the trouble. No mirror is fitted, but a pointer.

A. O. Griffiths.

Caergwrle, *June 7th*, 1926.

A Tip for the E.D.A.

In these days of coal rationing we are all asked to economise in the national interests, and by economising it is presumably meant that we should all use less gas and electricity, thereby cutting down the *quantity* of coal which is consumed at the gas and electricity works.

There is a big difference between quantity and *quality*, and a few recent incidents have led the writer to wonder whether our gas friends are quite as patriotic as their electrical competitors.

On arriving home the other evening, the writer heard a lot of grumbling in the kitchen, the complaint being that the rotten gas simply would not boil the kettle. Earlier in the day a similar complaint had come from the charwoman, who was mourning the loss of several more pennies which she had had to put in her slot-meter in order to get her usual *quantity* of gas.

Oh, yes, those of us who still use gas are being rationed all right, but apparently the rationing applies to both quantity and quality, and with the above-mentioned slot-meter

comments in mind, I am wondering whether my gas bill at the end of the quarter will be any less, or shall I lose on the swings what I am trying to save on the roundabouts. In other words, as a result of the poor quality of the gas, will my efforts at economising be knocked on the head by the increased hours I have to burn the gas and consequently a corresponding increase in quantity, which, no doubt, my gas meter will faithfully or unfaithfully register?

It would appear from the above remarks that a very nice little leaflet could be prepared by the experts of the E.D.A., as no matter how old or inefficient the plant is, or whether the "juice" is generated in Timbuctoo or—shall we say?—Hackney, it is all the same *perfect quality* and *cannot be deteriorated.*

Switching back again to the aforesaid gas grumbles, a further complaint was that the smell was decidedly more obnoxious than usual, so this, combined with the rationed quantity and poorer quality, has not acted as an advertisement for gas.

A few electrical slogans suggest themselves as follows:—

You can ration the quantity of electricity, but not the quality. There is and can be only one quality of electricity, and this is always perfect. There are no fumes with electricity, and consequently no smell. You can easily and safely control all your electrical circuits, and as for cleanliness, well—there is nothing else to touch it.

June 9th, 1926. **F. T.**

The Electrical Equipment of Collieries.

Your recent article on "Electricity in Mines" suggests a fairly reasonable and effective solution to the present coal problem.

Your contributor states that in American mines, where electrical coal-cutting machinery is installed, the output per man is three or four times what it is in this country. I don't know what it would cost to equip our mines with similar apparatus, but surely it would only be a fraction of the £23,000,000 said to have been spent by the Government on the subsidy—an expenditure, too, yielding no return.

If, now, the Government were to issue a loan, on similar lines to the War Loan, for the purpose of equipping the mines with efficient electrical machinery, the greatly increased output would not only enable interest to be paid on the loan, and in time pay off the loan, too, but would also enable wages to be maintained at their present level, and so solve one of the most pressing difficulties of the present situation. It would also place the mining industry on a sound foundation, and enable it to compete successfully in the markets of the world.

There would no doubt be difficulties of detail regarding the independence of the industry while partly financed by a Government loan, but these should not be insuperable—in fact, should be no greater than when the miners' wages were aided by a State subsidy.

Perhaps this suggestion will be worthy of discussion in your columns.

Liverpool, *June 10th*, 1926. **Stanley G. Joscelyne.**

Electrical Engineers' Salaries.

In the current issue a certain Council is applying for a mains assistant at a salary of £150 per annum. Does not this make an engineer feel that his scientific job is sadly on the down grade? The writer is not at present looking for a job, but feels very sorry for his brother engineers who have such insults as this flung at them. The advertisement is unfortunately typical of many that appear weekly in the REVIEW, and if this sort of thing continues it simply means that when a smart boy is anxious to become an electrical engineer, his parents will dissuade him from adopting that career. The result will be that in a few years' time no *real* engineers will be available. For the benefit of the Council which offers such miserly pay I would inform them that assistant cleansing superintendents receive a much more handsome salary.

June 5th, 1926. **Contractor.**

"Rings."

It is regrettable that so many valuable contracts are being placed abroad when our own country is at present in such a stagnant condition. In your issue of June 11th it is stated that the Leicester City Council has placed an order with a Zurich concern for a turbo-alternator. In the circumstances could it be blamed for choosing to deal with foreigners? The chairman of the Electricity Committee said that an examination of the British tenders revealed the remarkable absence of free competition, while subsequent events proved that the prices were fixed by a combination of British manufacturers. In other words "rings" are simply driving good business out of Britain and I, as an individual, would be happy to see all these unfair "combinations" made illegal. It is obvious to most of us that the prime function of "rings" is to keep prices inflated, and, of course, to prevent competition. Why should a few big manufacturers be permitted to dictate what the selling price of an article shall be when many of the articles could be sold at a much lower price and still allow a good margin of profit? From the writer's point of view "rings" are stumbling blocks to progress, as anything that stands for keeping up prices to an uneconomic level is useless to any country. I am all out for my own country, but in the particular instance mentioned above, had I been a member of the committee I should have felt compelled to agree with the majority in handing over the work to the foreign concern.

June 12th, 1926. **Non-Ring.**

[We think it only right to refer our correspondent, and others who are interested in this subject, to an article entitled "Prices of Electrical Plant," by D. N. Dunlop, published in the ELECTRICAL REVIEW, for February 29th, 1924, p. 330.—EDS. ELEC. REV.]

Trade-Mark Applications.

Trade-mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from June 2nd:—

Wylex. No. 467,926. All goods in Class 8.—G. H. Scholes & Co., Ltd., 27, Blantyre Street, Chester Road, Manchester.

Phonos (lettering and design). No. 466,768. Class 8. Apparatus for use in connection with radio-telegraphy and telephony.—Pettigrew & Merriman (1925), Ltd.

Cosmos Radio Valve (lettering and design). No. 467,878. Class 8. Thermionic valves.—Metropolitan-Vickers Electrical Co., Ltd.

Orolite. No. 468,322. All goods in Class 8.—O. Ruhl (1922), Ltd., 85, City Road, E.C.2.

Noirlac. No. 468,530. Class 8. Electric cables.—Falk, Stadelmann and Co., Ltd.

Lecite. No. 468,777. Class 8. Cables for electrical purposes.—Liverpool Electric Cable Co., Ltd.

Etho-Cone. No. 468,893. Class 8. Loud speakers and sound reproducers; and Etholog. No. 468,894. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Burndept Wireless, Ltd.

Vispark. No. 468,587. Class 13. Sparking plug heaters.—Miltiades A. Mitaranga, Marseilles. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

The I.M.E.A. Convention.

THE Convention which was held last week at Glasgow by the Incorporated Municipal Electrical Association, in despite of adverse conditions, must be set down as one of the most successful in the history of the Association; the attendance fell but little short of the high record attained at Brighton last year, in far more favourable circumstances, showing unmistakably that the members fully endorsed the decision of their Executive Council to carry out the programme as far as possible, and the weather, which is so important a factor on such occasions, with the exception of one bad break, was mostly fair and sometimes excellent, being especially gracious during the delightful excursions to the Trossachs and the Falls of Clyde which brought the Convention to a close. The only notable departure from the original programme was the unavoidable abandonment of the river trip, and this proved to be a fortunate chance, for it fell on the one rainy day; instead, a visit was made to the Gleneagles Hotel, where fair weather prevailed, and as the President remarked after dinner, in expressing the thanks of the Association to the Babcock & Wilcox Company, a trip on the river in the rain was a thing to be avoided. Mr. R. B. Mitchell is to be congratulated on his admirable conduct of a most enjoyable Convention, and on the efficiency with which he and his staff collaborated with the honorary secretary, Mr. A. C. Cramb, and the secretary, Miss Lanfear, and her assistants in the work of organisation under unusually difficult conditions.

Mr. R. W. L. Phillips, of Bedford, was elected president for the ensuing year, and will be faced with the problem of housing so large a body of members; doubtless, as Bedford cannot possibly provide adequate accommodation, the Convention will be held elsewhere, and various more or less helpful suggestions have been put forward to solve the problem. It is interesting to note that, following the chief of one of the largest undertakings in the country, the new President represents one of the smaller ones, whilst Mr. F. W. Purse, the new vice-president, who was formerly a champion of the small undertakings and took a prominent part in securing their direct representation on the Council, is now in charge of an undertaking which falls within the "large" category.

Seeing that the membership of the I.M.E.A. now stands at 225 (out of 264 undertakings eligible for membership), the fact that the attendance numbers about 700 indicates that the engineers are in the minority; that so many councillors take part in the Convention is a highly advantageous circumstance, as it enables them to exchange views on electricity supply and to absorb new ideas with regard to progress and enterprise, which must bear fruit in the enlightened management of their own undertakings. The greatest drawback to municipal electricity supply is undoubtedly the necessity of entrusting so highly technical a business to the hands of lay committee-men who, through no fault of their own, come to the work with absolutely no training for it and generally with no prior knowledge of its complexities; the Conventions offer to those who have so far triumphed over their difficulties as to attain the rank of chairman priceless opportunities for improving their knowledge and broadening their outlook. The popularity of these meetings is further exemplified by the large number of ladies who take part in them, and this factor is being turned to good account from the business point of view, by enlisting their services in the work of development with the aid of the Electrical Association for Women, which is rapidly gaining strength and, under the able management of the chairman, Alderman Mrs. Hammer, the secretary, Miss Haslett, and an energetic committee, is destined to play a notable part in hastening the adoption of electricity for every domestic purpose.

The professional work of the Association on this occasion, without being too burdensome, was both varied and interesting; the papers were practical, and the visits instructive. The latter included an up-to-date and highly efficient steam power station, a hydro-electric installation of some importance, and (on Saturday) an example of co-operative enterprise in the shape of the rapidly developing joint undertaking of the Ayrshire Electricity Board, which embodies the principles of interconnection, centralisation of generating plant, extension into rural areas, and the supply of power to a variety of industries from one station—all highly commendable and tending to promote the public welfare. The electrical exhibition which was held in connection with the Convention was also larger, more varied, and better organised than on any previous occasion, reflecting great credit on all who took part in its preparation—amongst whom the first place must, of course, be given to the British Electrical Development Association. Several new devices of considerable promise were shown at this exhibition, and attracted a great deal of attention; we anticipate that the exhibitors will have no ground for complaint with regard to the business side of their participation, whilst the educative effect of the show, which was open to the public during certain hours, must have been very valuable.

It should be borne in mind that the "slogan" of the Lord Provost and the Electricity Committee of Glasgow Corporation is "cheap electricity," and that their practice is in accordance with their precept; electrical energy is supplied for domestic purposes at $\frac{3}{4}$d. a kWh, plus a small fixed charge, and during the night, for heating water, it is available at $\frac{3}{8}$d. per kWh. As Dr. S. Parker Smith has shown, at these rates there is every inducement to use electricity for all domestic purposes, without the aid of coal or gas, the saving in labour not only lightening the burden of housework but actually resulting in economy of wages, in addition to the reduction in cost of maintenance. Wherever such conditions obtain—and we understand that they are already available to four million people in this country—the *all*-electric house is a practical economic proposition.

Finally, turning to the report of the Council, of which we will print an abstract next week, we find that the committees have done very good work in connection with the improvement of electric cookers, with especial attention to the question of standardisation, and with the reform of the regulations for overhead line construction, which we hope will be materially influenced by the recommendations which the Council has submitted to the Electricity Commissioners.

Our Trade Names Supplement.

ACCOMPANYING the present issue of the ELECTRICAL REVIEW, we are circulating, free of charge, to the whole of our readers at Home and overseas—approximating to 13,000—the first of a series of four Quarterly Supplements of Electrical Trade Names. We have had abundant evidence of the need for such a publication in the thousands of inquiries that have reached us during the last few years asking the names of the makers or suppliers of a specified piece of apparatus, article, or material.

Every day we receive communications from correspondents at home and abroad telling of something electrical that they wish to purchase but cannot, because they only know its trade name. Generally, we are able to answer these questions through the post, and business passes on to the manufacturer or trader. We do not begrudge this service—indeed, we like to render it—for in serving non-electrical buyers we are bringing them into direct touch with the electrical trade. But we are convinced that the publication of the information in the form of a special periodical supplement will simplify the operations of our readers and save some of the time that is necessarily lost in sending in inquiries, hunting up our records, and dispatching replies. It is safe to calculate that for every inquiry that reaches us there are many others which are never made, but can easily be satisfied by reference to a printed list. We believe that if this Supplement is in the hands of the whole body of ELECTRICAL REVIEW readers everywhere many questions can be settled at once as they arise. The value of the Supplement will be increased as the entries are added to in successive issues, but it is not intended to supply this directory of trade names apart from the ELECTRICAL REVIEW. Our Service Department will continue its activities in this and other directions, and correspondence is invited from those in need of information not at present obtainable from our list.

Municipal Selling Powers: Agreement at Swindon.

WHEN these lines appear in print the Convention of the Electrical Contractors' and Allied Associations will be in progress at Brighton, and prominently before the minds of all present will be the question of municipal selling powers. Already the subject has received prominence at the gathering of the I.M.E.A. both in the address of the president and in the report of the Council, while other important deliberations have been taking place for some time past. What has happened in connection with several Bills before Parliamentary Committees is familiar to our readers, and we may now direct attention to the Swindon Corporation Bill case, which is reported on another page of this issue. The Corporation sought under one of the clauses of its Bill relief from its existing obligation to carry out the wiring of premises only through a contractor. As a result of negotiations between the I.M.E.A. and the E.C.A. the opposition to its application for this relief was dropped subject to a number of conditions which are set out in our report. These conditions entail a regulation of the prices at which installations and apparatus shall be sold; retail prices to the public and trade prices to contractors. The prices are to be fixed at such figures as shall cover all expenditure, including financial charges, and the accounts for such trading operations are to appear separately in the published returns of the department. The aforesaid retail and trade prices will be determined by a committee representative of the interests concerned, which committee is to be appointed by the Electricity Commissioners.

The Efficiency of Gas Works.

IT is well known that gas engineers claim to obtain an efficiency of 75 or 80 per cent. in the manufacture of gas from coal, and that for this purpose they include the gross heat content of the coke and tar on the credit side of the account, regardless of the fact that the heat thus "recovered" cannot be utilised without a further process of conversion involving heavy loss; in point of fact, the heat in the tar is not usually

employed as heat at all. But there is another way of looking at the matter which does not seem to have received due attention.

In the course of an able paper on "Competition with Electricity," read by Mr. H. E. Copp, of Hull, at a recent meeting of gas managers in Newcastle-on-Tyne, the author states that the gas produced from coal represents 23 per cent. of the original energy, the coke 46 per cent., and the tar 6 per cent.—total, 75 per cent., the loss being therefore 25 per cent. The object being primarily *to produce gas*, and the by-products (coke and tar) being entirely superfluous to that end, the actual result should be stated thus:—

Heat originally in coal, B.th.u.	...	100
Heat remaining in residue ...	...	52
Heat operated on in gas manufacture		48

Of the last-named quantity, 23 B.th.u. is contained in the gas, and 25 B.th.u. is lost. The efficiency of conversion is therefore at the most 48 per cent. ($100 \times 23 \div 48$), not 75 per cent. Moreover, the heat not usefully operated on—namely, that remaining in the coke and tar—is rendered less readily available than in its original lodging, and is therefore depreciated in value.

The Strike and Electrical Exports.

It might reasonably have been expected that our electrical export trade during the month of May would be very seriously affected by the general strike, but the recently-published Board of Trade return does not present a picture fulfilling expectations, which, for once in a way, is all to the good. The decline from the April total was only £40,878, but then April was itself a bad month. A better comparison is with the corresponding month of last year, but this shows an apparently appalling drop of over half a million. An examination of the details, however, provides an item of information which, while not entirely discounting the decline, goes a long way towards explaining it. We refer to the huge fall in the value of exported submarine cable—from £373,597 to £246. This particular section for obvious reasons cannot be excluded from the table which we prepare from the Board of Trade return each month, but its almost fantastic movements make fair comparison practically impossible. In the case under examination its exclusion would have reduced the decline from the May, 1925 total to £176,784; this, of course, is a fairly large decrease, but matters are given a considerably more favourable appearance.

The decrease as compared with the corresponding month of the previous year was £364,209 in January and £406,367 in April, of which submarine cables accounted for £259,193 and £278,195 respectively. This appears to show that, in spite of the general strike, the position was not much worse in May than it was in January and April. A similar explanation serves to show the reason for the decline of £1,109,770 in the total for the first five months of the year as compared with January-May, 1925. The net decrease in the value of exported submarine cable during this period amounted to £919,041.

It is thus clear that the electrical industry generally is not losing its export trade, and we have no doubt that the remaining seven months of the year will witness greater activity if the coal dispute is soon settled and further industrial troubles are avoided.

Servants and Electricity.

We wonder whether those who are already doing such excellent work in organising what we may term the woman's side of electricity supply are devoting attention to the household domestic. Electricity is sometimes credited with providing a solution to the servant problem. It may well happen that when full use is made of electrical appliances the number of domestics required will be lessened, and beyond all possible question the change can lighten the labour of the one solitary maid or the daily help, and what is even better still for very large numbers of people, it can lessen the strain upon the busy wife and mother. But the servant and her likes and dislikes—shall we say predilections and prejudices?—particularly the latter, require a good deal of careful attention. Electrical women of tact have here an excellent opportunity for the exercise of their peculiar gifts in dispelling ignorance and removing prejudice. We heard recently of a public personage in a particular locality who, impressed at a local showroom with the merits of the electric vacuum cleaner, electric fires, and so forth, ordered delivery thereof to be made at his abode, but unfortunately he had not previously consulted those in authority, and to his bewilderment he found that either those appliances or the established domestics would have to go. Of two evils he chose the lesser one, and so chooses still, preferring to forgo the delights of electrical advance for a season rather than to dispense with the pleasures of domestic felicity. Who has not heard, too, of menservants who make use of certain electrical contrivances for a time, but when the novelty wears off or when something, however slight, gets out of order, leave them unused?

In most cases we believe that initial prejudices of servants can be overcome as the result of experience of the benefits attending practical use of apparatus, but perhaps we have been too solicitous for lightening the load of the mistress by solving her servant problem and have paid too little attention to the thoughts, limbs, and wishes of the maids themselves. Electrical women will know how best to reach them, to educate, and to convince them.

Supplies to Outlying Districts.

The paper read by Mr. S. E. Britton on the first day of the I.M.E.A. Convention was intended to draw attention to the advantages of extending the operations of existing electricity supply undertakings into the surrounding districts, and the difficulties which impede that process; no one is better qualified for the purpose than the author, who has had plenty of experience under both these heads. As he eloquently demonstrates, the electricity supply industry in this country has been, to say the least, unfortunate in the legislation with which it has been favoured, and even the working of the Act of 1919 fails to gain his approval. Mr. Britton, in fact, is a wholehearted advocate of freedom for individual undertakers to develop their areas with the minimum of administrative interference. It was very clearly evident at the Convention that there was a strong current of opinion in municipal circles adverse to the Electricity Bill in its original form, and that the interference with local management which appears to be threatened is strongly resented, particularly by the larger undertakings. There is a widespread feeling that development should proceed on normal lines, without the adoption of artificial methods which are likely to increase the cost of electricity where it is already cheap, in order to reduce the price where it is unduly high. The views to which we have on many occasions given expression were, in fact, generally endorsed both in public and in private.

With Mr. Britton's comments on the undue stringency of the regulations for overhead lines, the difficulties in obtaining wayleaves, and the many other obstacles to the erection of aerial conductors, we are of course in the fullest agreement. Not only is the industry overburdened with harassing regulations and cumbrous procedure—it is also hampered by exaggerated reverence for private rights, which are allowed to restrict development to an extent unheard of on the Continent and in America. It must be realised that the supply of electricity is a public service, which must not be subordinated to the whims of private persons or the wayleave cupidity of the owners and occupiers of land. We do not suggest that electrical undertakers should be granted autocratic powers to ride roughshod over private rights; but they should not be at the mercy of every profiteer that they encounter, nor should they be required to wait for months before wayleaves can be obtained. As Mr. Britton urges, the procedure should be immensely simplified, and should be in the hands of local officials. Why this important matter has been omitted from the Bill is incomprehensible.

The Clyde Valley Electric Power Co.

Hydro-Electric Power Developments.

THE present consolidated position of the Clyde Valley Power Co., which came into being in 1901, abundantly justifies the foresight of its founders, and Mr. E. T. Goslin, M.I.E.E., chief engineer and manager, maintains the enterprising and far-sighted principles set up by his distinguished predecessors in the general management. There is an unmistakable spirit of enthusiasm and zeal for electrical development permeating the whole staff, which is sensed throughout the entire one thousand and thirty-three square miles of the company's allotted area.

Fig. 1.—The Clyde Valley Electric Power Co.'s Area of Supply.

The two original stations, at Yoker and Motherwell, planted strategically on the river banks, one below and the other above the Glasgow boundaries, bore the vicissitudes of the early years. The varying fortunes of the steel works and collieries around Motherwell and of the shipyards and repair shops at Yoker kept the economic load fluctuating rather more than was desirable to enable the best results to be obtained; so in 1910 the almost prophetic step was taken of linking-up these two important distant stations by a through line, skirting Glasgow on the south. Remunerative progress was then assured, and within three years from the time of inter-connection the maximum load on the system had more than doubled, and had passed 10,000 kW. The next important step in the company's growth was marked by the establishment of the station at Clydes Mill, which grew with great rapidity during the war to super strength, and is most favourably adapted for further extension. These three generating stations now distribute to the area through 253 sub-stations. The accompanying Table I indicates the recent output, and illustrates the important group of key industries served by the company.

TABLE I.—ANALYSIS OF RETURNS.
Year ended December 31st, 1925.
SUMMARY OF OUTPUT AND REVENUE.

		Gross energy sold		Amount received	Av. price per kWh. sold
		kWh.	%	£.	d.
1.	General power users	29,889,373	17.55	135,249	1.086
2.	Collieries	31,072,709	18.24	120,351	.929
3.	Textiles	4,200,871	2.47	20,454	1.168
4.	Bulk	30,411,102	17.85	69,534	.548
5.	Traction	1,831,811	1.08	11,535	1.511
6.	Engineering & repair shops	21,483,976	12.61	103,629	1.157
7.	Shipyards	14,168,207	8.32	62,654	1.061
8.	Iron & steel works ...	37,268,463	21.88	107,573	.693
		170,326,511	100	630,979	.889

The installed plant capacity of the Yoker station is 35,750 kW, that of Motherwell 18,000 kW, and that of Clydes Mill 50,000 kW, giving a total for steam generation of 103,750 kW; this will be increased by 15,520 kW when the new hydro-electric plant is ready—probably by the end of the present year.

The Hydro-Electric Scheme.

This is a most important development of the activities of the company, representing as it does the linking-up of hydro and steam generating stations for varied industrial supply over a wide area.

British rivers have not the abundant natural reserves to be found in some larger countries, and adequate storage methods involve great expense. Isolated hydro-electric stations can only give a constant efficient output if designed for dry-season conditions. It would therefore seem that the peculiar problems of the utilisation of this country's coal and water-power resources are being happily solved in the Clyde Valley, where the large steam stations are located at the centre of the coal-producing districts and linked with hydro stations of a capacity sufficient to employ the available water power. The water, much or little as the seasons decree, goes to conserve the coal. The torrents and snows of the distant hills in winter give work and warmth and light in the towns, and in future springs and autumns the coal stations will pay back their debt to the country places and to agriculture.

The Falls of Clyde have long been places of pilgrimage by lovers of beauty. The Bonnington Falls are a mile or so upstream from the town of Lanark, and the Stonebyres Falls are downstream from that town. The latter, being the more easy of access, are the better known to visitors; but the Bonnington group has more grandeur, as there, after an impressive cascade, the river sweeps onward through a half-mile chasm, with perpendicular rock walls, and then at Corra Linn falls sheer into a reverberating and deep cavernous basin. The

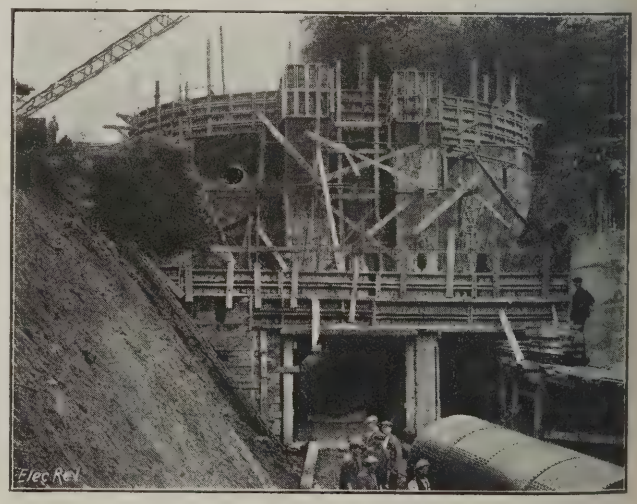

Fig. 2.—Bonnington Surge Tank, showing Pipe-line Exit.

Falls, and the works of the company associated with them, were visited by the members of the I.M.E.A. during the annual Convention which was held at Glasgow last week.

The Bonnington Scheme.

This "Astounding Flood!" in Wordsworth's phrase, is now being trapped to form the upper of the new hydro-electric stations.

The two schemes have much in common. In each a sloping intake at the weir leads to a subterranean tunnel, and each of the tunnels feeds a pair of steel pipe lines which run from a surge tank to a pair of turbines in the corresponding station. The Bonnington station utilises two falls, *i.e.*, Bonnington and Corra Linn, and has a longer tunnel and pipe line with a higher available head, while the lower scheme at Stonebyres has a greater volume of water to deal with.

A weir is in course of building above the Bonnington Falls, and the power house for this scheme is placed about one hundred yards below the Corra Linn Falls, the total head of water being 189 ft. from weir to tail-race.

The Weir.

The weir is of novel construction, having three automatic tilting gates of steel, fixed to a concrete sill on knife-edged pivots. Each gate has counterweights in the form of floating iron boxes. When the river rises the tilting gates are depressed and so guard against undue flooding; during highest flood level the tilting weirs are levelled right down to the river bottom, and the fact that the counterweights are of the floating type ensures that the gates do not rise till the waters have abated.

Fig. 4 shows the present stage of construction of this weir, with the river diverted to half its normal width by a temporary dam. The picture also shows that the reinforced-concrete pillars which flank the gates carry a bridge roadway. A hand-operated sluice gate is fitted on the right of the weir.

The intake is also at the right of the weir, in the foreground of the picture. It is 50 ft. wide, and is fitted with screens which are inclined to the horizontal at 60 deg. The parallel-rod screens are arranged in portable rectangular grid sections lying in guides. The sections can be readily raised for special cleaning if required.

Between the rough and the intermediate screens the bottom of the intake is formed into an efficient sludge trap channel, which can be flushed out by means of two sluice gates.

The Tunnel.

The bottom of the intake slopes to the tunnel mouth, which is fitted with a sluice gate and inspection shaft. The tunnel is 10 ft. in diameter and 773 yards long, with a slight inclination.

While a great part of the tunnel track is through rock, some difficulties had to be overcome where shifting sand and water were encountered. These places have been cleverly and skilfully dealt with by a cementation process; this has the effect of making the liquid sludge encountered into a powdery rock which can be readily tunnelled. The sludge is pierced at numerous points by long tubes, and a mixture of cement and silica is then forced at great pressure through the tubes, the pressure being maintained while the tubes are being gradually withdrawn. In a short time the cement sets and cakes its surroundings.

Cast-iron bolted segments are being used to line the parts which are not cut through solid rock. The entire inner surface is finished off with smooth cement. The tunnel ends in a circular reinforced-concrete surge tank, which measures 61 ft. across. The surge tank is provided with a fine screen and arrangements for discharging silt and *débris*. Bell-mouthed exits are provided for the pipe lines. Two steel pipe lines, each having sluice gates, run from the surge tank down to the turbines in the power house. The sluice gates are separately controlled by oil pressure from the pump which supplies the oil-operated turbine governor relay valve.

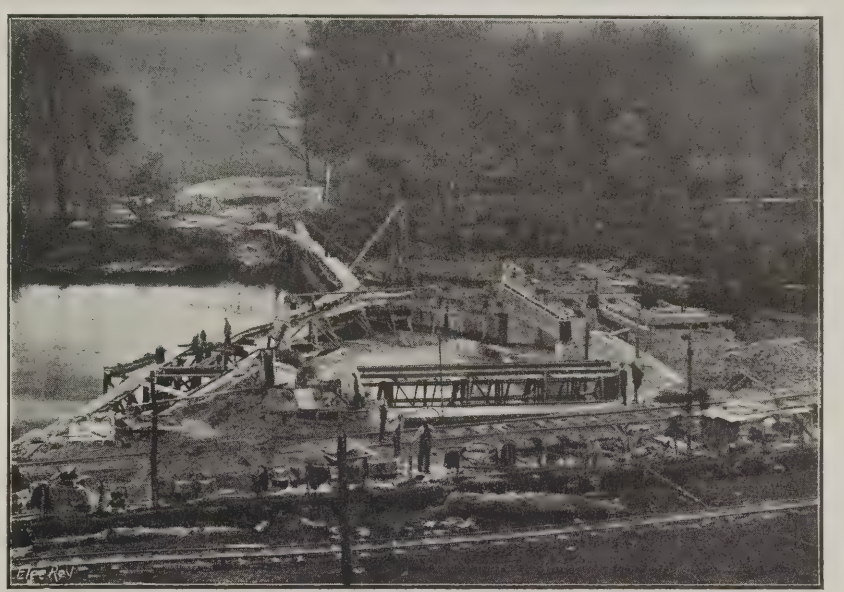

Fig. 4.—Bonnington Weir under Construction.

Fig. 3.—Bonnington Pipe-line, showing Anchor Blocks.

Fig. 5.—Stonebyres Falls.

Pipe Lines.

The steel pipe lines are each of 6 ft. 6 in. internal diameter. The riveted plates have a minimum thickness of $\frac{3}{8}$ in. for the upper portions, increasing to 9/16 in. at the lower end. The pipes are provided with massive concrete anchor blocks and supports, and lie on plate cradles grooved for the entry of rust-preventing grease. Expansion joints and inspection doors are provided, and the pipes terminate in two hydraulic balanced valves inside the power house.

Fig. 6.—Stonebyres Weir, showing Intake Screen and Tilting-gate Counter-weight.

The Bonnington Station.

The station buildings are pleasing in design, and strike no harsh note with their surroundings. It may be said here that nowhere in these schemes do the buildings, weirs, or works obtrude or clash with the natural beauty of the district. For this no doubt great credit is due to the special Amenity Committee which considered this important aspect of the matter.

The station is of the one-floor type, and the turbine house measures 97 ft. by 37 ft. 6 in. The main space is, of course, to be occupied by the two turbo-generators. A gallery 8 ft. above the floor and running across the station carries the e.h.p. control board. The low-pressure a.c. and the d.c. switchboards are placed beneath this gallery.

An annex on the downstream side of the turbine house will hold the 11,000-volt switchgear, booster transformers with regulating gear, and a battery for the control mechanism.

A portion of the annex is allotted to the e.h.p. switchgear, and has room for 12 lines of main switchgear. Another portion houses the station auxiliary transformers and the booster transformers for the main transmission lines, the regulating switchgear being immediately above. A house for the senior attendant, with workshop, &c., is placed at the upstream end of the building.

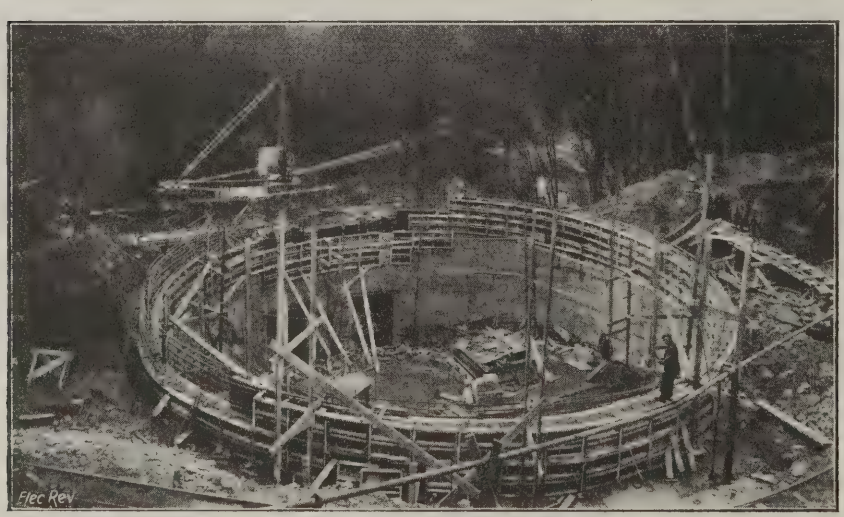

Fig. 7.—Surge Tank at Stonebyres.

Turbines, Alternators, and Auxiliaries.

The circular foundations are now set for the two turbo-alternators. The machines will run at 375 r.p.m., and will be of the vertical reaction type, each of 6,750 h.p., coupled to a 25-cycle, 11,500-volt alternator of 6,150-kVA output.

Each turbine will be provided with an automatic governor with servo-motor and connecting gear to control the swivel gates for the water. A time-lag relief valve is to be provided to divert the water to the tail race, which will act upon a sudden cessation of the load.

The governors will be provided with a return motion gear coupled through a relay to a float at the intake works. Thus the degree of opening of the turbine gates will be regulated according to the water available in the river. The vertical-shaft generators will be directly coupled to the turbine shafts, and the exciters will be carried on shaft extensions.

The auxiliaries will include a motor-generator charging set for the batteries, one motor-driven oil pump for the governor and head-bay sluice gates, one water-wheel coupled to an oil pump as stand-by to permit of the station starting up independently of an outside electricity supply, and two 50-kVA transformers for auxiliaries and local lighting.

Fig. 8.—Tilting-gate Fully Open with Sluice Gate on Left.

The total output of Bonnington station, with a water flow rate of 825 cu. ft. per second, will be $4{,}920 \times 2 = 9{,}840$ kW at 0.8 power factor.

The Stonebyres Station.

Stonebyres is about three miles further down the Clyde from Bonnington, and will utilise the water which will be returned to the river from the upper station. The stream is augmented by the tributary stream, Mouse, which reaches the Clyde above Stonebyres, and the catchment area is 54 square miles additional to that serving Bonnington; it embraces 385 square miles net and has an average annual rainfall of 43 inches.

Tilting weirs are also employed at Stonebyres, and these have been modified to suit the altered configuration of the river. The intake and screen arrangements are similar for both stations.

At Stonebyres the tunnel, surge tank, pipe lines, turbines, &c., are all of similar type to those at Bonnington, but with the slight modifications in design required to deal with the increased water flow rate which will be 911 cu. ft. per second. The tunnel here is shorter, being 492 yards long, and its diameter is

11 ft. The total working head from weir to tail-race is 97 ft. 6 in.

The twin pipe lines are, at Stonebyres, comparatively short, and no relief valves or hydraulically-operated valves are being provided on the turbines, the water entry to the pipes being controlled by oil-pressure servo-motors.

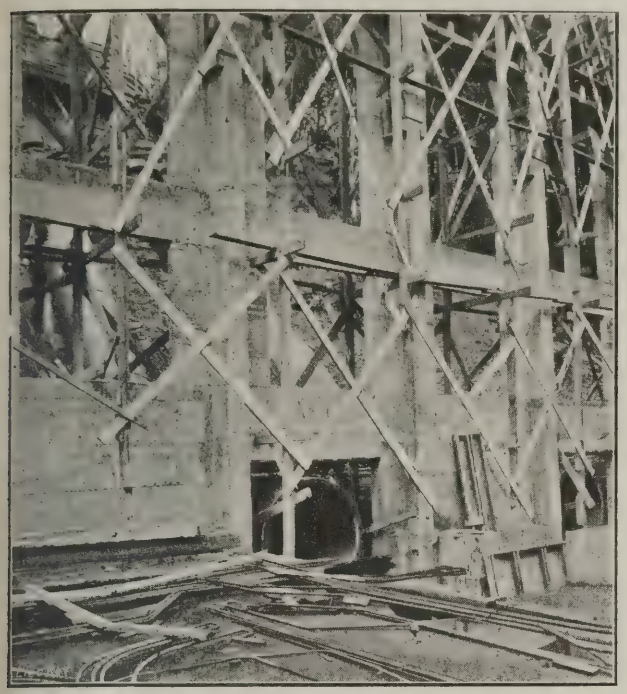

Fig. 9.—Stonebyres Station, showing Pipe-line Entrance.

The turbines and general design and equipment and the buildings are all like those at Bonnington. The normal speed of the turbines will be 375 r.p.m., and each is to be coupled to a 2,840-kilowatt, 11,000-volt alternator. The total output of Stonebyres station will be, therefore, 5,680 kW, as compared with 9,840 kW at Bonnington.

To correct voltage fall between stations, the plant at Bonnington has been designed for normal working at 11,300 volts, and that at Stonebyres for 11,000 volts.

Transmission Scheme.

Bonnington and Stonebyres will be linked by two interconnectors consisting of two 3-wire lines on separate pole routes.

A north interconnector to the steam generating system, consisting of a six-wire overhead line on one line of poles, will go direct from Bonnington to the Overton switch-house on the existing Clyde Valley Co.'s 11,000-volt network, traversing the burgh of Lanark, the town of Carluke, and the villages of Law and Braidwood.

A south interconnector of similar construction will join Stonebyres with the Motherwell station. This line will serve Larkhall, Stonehouse, and Strathaven.

A third direct transmission line will connect the Stonebyres and Motherwell power stations.

The necessary correction of line voltage will be dealt with by boosters at the different stations, and, where required, these will have their current and pressure windings split to form part of the split-conductor protective scheme.

At the towns and villages through which the lines will pass, the necessary transforming arrangements are being made for local supply.

The placid flow in the upper reach of the river gives place to the spectacular double falls at Bonnington, where the channel traverses a rocky gorge and half-mile chasm between perpendicular cliffs from 70 to 100 ft. high, the site being one of the few in this country where hydro-electric power development of any magnitude is possible without the aid of costly storage reservoirs. The undertaking of the scheme, by the Clyde Valley Electric Power Co. and its associate, the Lanarkshire Hydro-Electric Power Co., reflects great credit on all concerned in it.

The civil engineering and building constructional work is being carried out by Messrs. Sir Wm. Arrol and Co., Ltd., to the designs and specifications of Messrs. Buchan & Partners. The electrical and hydraulic plant equipment is by the English Electric Co., Ltd. The work is being superintended by the Clyde Valley Co.'s engineers under the direction of Mr. D. Macfarlane Mcleod, to whom, and to the chief engineer, Mr. E. T. Goslin, we are indebted for facilities to prepare this article.

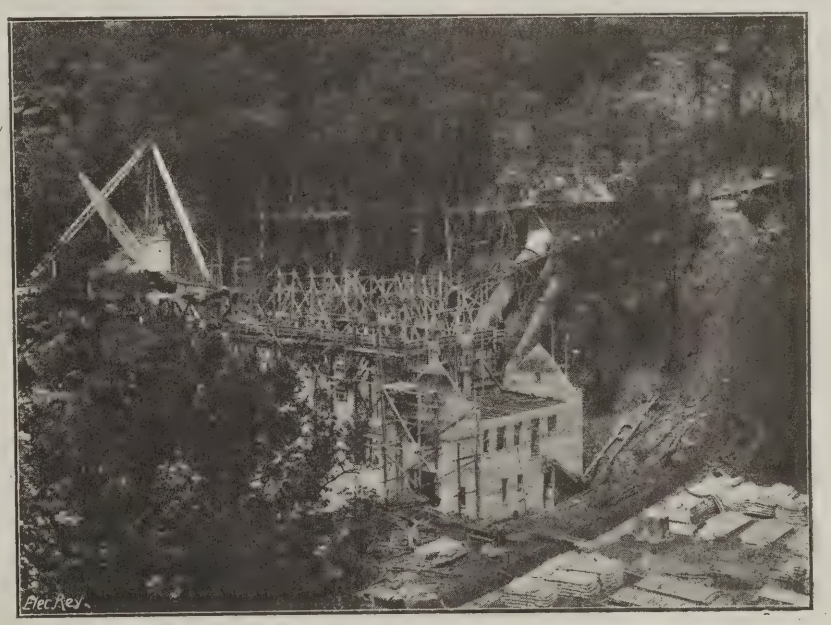

Fig. 10.—Stonebyres Power House in Course of Erection.

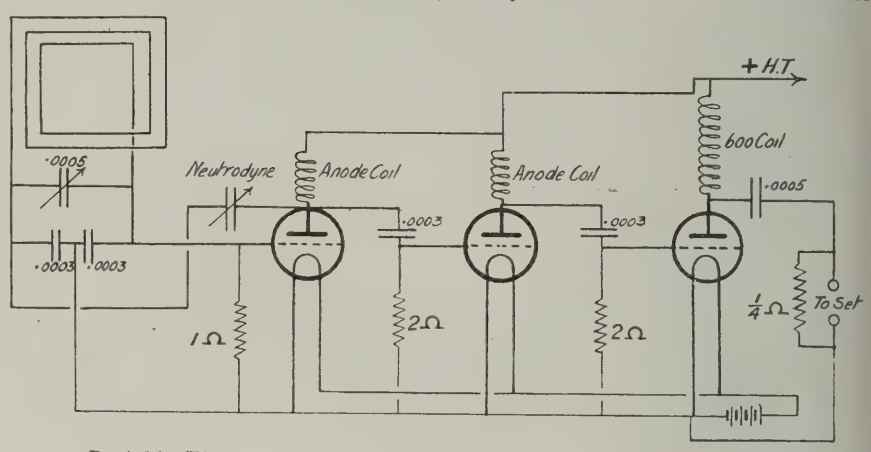
Demonstrating Radio Apparatus.

A New Idea—Take it to the Customer's House.

By PAUL D. TYERS.

Now that the wireless public is becoming more critical and is beginning to realise the possibilities of true reproduction, the subject of demonstration is one to which greater attention must be paid than has hitherto been necessary.



It is frequently of little use trying to convince the possible customer of the capabilities of some particular receiver merely by the usual form of sales promotion literature. The prospective purchaser is usually instinctively sceptical, and a demonstration is the only possible way to stimulate any real interest. Here, again, the trader may find another obstacle in his path, due merely to apathy. Once he can persuade his client to come into his showroom and listen to a demonstration of the set, he certainly has a very good chance of making a sale, provided, of course, that the instrument gives a sufficiently good performance. In nine cases out of ten, however, it is only with the greatest difficulty that this type of client can be persuaded to summon sufficient energy, or take sufficient trouble, to be interested to this extent. If, then, a sale is to be made, and the proverbial mountain will not come to Mahomet, Mahomet must go

to the mountain. In other words, the trader has to take the set to his client's house.

Usually the trader is debarred from demonstrating in the client's house owing to the absence of a suitable aerial and earth, and such a procedure has usually only been possible when the set is of the portable or frame aerial type.

However, it is really very easy to build a portable amplifier which can be substituted for the aerial and earth system, and used in conjunction with any ordinary type of broadcast receiver, thereby enabling a demonstration to be carried out almost anywhere, and under any conditions. In order to avoid a multiplicity of tuned circuits and not to introduce complication it is preferable to build an amplifier of the impedance-coupled type, so that there is only one tuning control, that is, the frame condenser. Several types of semi-aperiodic anode impedances are on the market, and these can conveniently be used. The accompanying diagram illustrates a three-valve, high-frequency amplifier used in conjunction with a frame aerial on the lines suggested. A neutrodyned input circuit is employed, and if a centre tap frame is not available the arrangement of two condensers shown in the diagram should be utilised. The anode circuits of the first valves contain tapped anode impedances of any well-known make, while the anode circuit of the last valve contains an inductance such as an Igranic 600 coil. The output of the amplifier is taken from a small condenser of about .0005 mfd., and a $\frac{1}{4}$-megohm grid leak, the two output terminals then being connected to the aerial and earth terminals of the set. Common batteries may be used for the frame amplifier and the set if desired, but it will probably be found essential to use condensers across the high-tension tappings in order to prevent parasitic oscillation.

When demonstrating with a frame amplifier of this type care should be taken, if working very near to a broadcast station, not to blast the set by obtaining too great a potential on the grid of the detector valve. This trouble can very easily be eliminated, preferably by rotating the frame so that it is slightly out of the maximum position. A frame amplifier of the type referred to can very easily be built into a case which also contains the batteries for both sets and the frame aerial itself. The cost of building the frame amplifier is comparatively negligible, and it should prove of great assistance in demonstrating anywhere. If desired, the frame amplifier may be provided with outside aerial and earth terminals, so that it can be used to boost up signal strength when only a very poor aerial is available. Here, again, the frame amplifier should be found valuable for demonstrating in public buildings, when, usually, far from efficient temporary aerials are to be obtained.

Portable Three-Valve High-frequency Amplifier and Frame Aerial.

The Electricity Supply Bill and the Consumer.

By R. W. WEEKES, A.M.Inst.C.E.

THE President of the Institution of Electrical Engineers, in his constructive criticism of the above Bill, published in your issue of April 30th, states his opinion that—

> "Our backwardness in the use of electricity is due rather to the inefficient and hampering legislation of the past than to the shortcomings of the electricity undertakings."

This is not borne out by Section 12 of the Report of Lord Weir's Committee, which reads:—

> "In using these figures it must be remembered that they include only the consumption from authorised undertakings. In this country, due to the existing high price of electrical energy, in many parts of the country, and the dependence on small generating stations, many industrial users and private persons prefer to generate their own electricity. The amount of privately generated current is not accurately known, though a census was made in two given areas to form some opinion. It is estimated that if energy from every source, both public and private, were included, the consumption per head in this country would be raised from 110 units to about 200."

If this estimate is correct, 45 per cent. of the electricity used in this country is still produced by private plants, and this is a serious reflection on the authorised undertakers. In my experience several plants have been installed due to the high prices asked for a supply by the authorised undertakers of the districts in which they were situated. To give two cases: Some years ago I acted for a large concern in the Midlands which worked continuously from midnight Sunday to mid-day Saturday. The load factor was unusually high in consequence, but the engineer of the supply undertaking concerned would not quote lower than 2d. per unit. He stated that the price for power had to be high because there was no demand for power in his district. In point of fact his argument should have been reversed. There was no considerable demand for power from the public because the price asked was too high. His successor, some five years later, fixed up a contract with me for some other clients for a smaller factory, working ordinary hours, at a price just over 1d. per unit. Under new management this supply undertaking has grown rapidly, and the present rate of increase is above the average. The other case, within the London area, is quite recent. At a factory with normal hours and a maximum load of about 350 kW, large extensions were to be made, and the question of a new private plant *versus* a supply from a company's main had to be decided. The price demanded averaged 2.55d. per unit, and the larger private plant was installed.

Supply for lighting is, in many places, equally calculated to prevent consumers from coming on or mains being laid to supply them. Last year I built a house about 12 miles from London, on a new estate. The Metropolitan Water Board, the Gas Company, and the Post Office Telephone Department laid their mains down the newly-made roads to serve the first houses built. The electricity undertakers had a high-pressure main in the road bounding one side of the estate, but it took 11 months to get them to lay a low-pressure cable up my road, and a scheme to put down a private plant to

supply the estate was practically completed before the company would move. The charge is 10d. per unit for light and 3d. for heating, which naturally prevents many inhabitants from taking supply. It limits the use of electric heating and makes electric cooking prohibitive. My conclusion is that past legislation is not responsible for the above cases, but that the undertakers failed to exercise their powers properly.

The influence of cost of supply on demand is not recognised by some undertakers, as the curve published in Section 13 of the Report of Lord Weir's Committee shows; or else they deliberately prefer to supply a few consumers at a high price rather than deal with a larger output and many consumers. The following comparative figures for two residential areas near London of about the same population bear this out:—

Year ended		Pop. about	Units sold	Total revenue	Av. Price obtained per unit	Units sold p. hd.
Dec. 1924	Bromley & Chislehurst	44,000	1,552,963	£48,555	6.9d.	35.3
Mar. 1925	Tunbridge Wells ...	46,700	3,022,302	£42,623	3.20d.	64.5

Perhaps in the above comparison, past legislation had some influence. The Tunbridge Wells Corporation has the security of tenure that the 1888 Act gives to municipal bodies. The Bromley Electric Light Company may lose its powers in 14 years, and hence the directors may not find it easy to raise further capital for the larger mains so urgently needed. In the meantime the inhabitants suffer from the restricted supply which is the result of high prices. At Tunbridge Wells the units sold have increased 140 per cent. in the last four years, while at Bromley the increase has been only 54 per cent. To carry the comparison further, neither of the two undertakings is well situated as regards coal and water. In spite of this, Tunbridge Wells accounts show a works cost of 1.67d. per unit sold. At Bromley a large part of the energy is purchased in bulk, and yet the works cost per unit sold was 2.98d. for the corresponding year. It is on this figure that the Electricity Supply Bill will have effect if Parliament passes the measure. It is certain that the proposed Central Electricity Board could give bulk supply to both these undertakings at a price below the figures quoted above, and the Board can also insist on the benefit being passed on to the consumers. This would be done under Clause 14 of the Bill, which reads—

"Where in any year the Board notify to any authorised undertaker owning a generating station, not being a selected station, that the Board are in a position to supply directly or indirectly to those undertakers the whole quantity of electricity required for their undertaking on specified terms, and are satisfied that the cost of the supply on those terms is below the then prevailing cost to those undertakers, and those undertakers refuse or within three months after such notification fail to agree to take such supply directly or indirectly from the Board, then, if the Electricity Commissioners are satisfied as respects the next subsequent year that the cost of production of electricity generated by those undertakers substantially exceeded the cost they would have incurred had they purchased the like quantity of electricity directly or indirectly from the Board on the specified terms, the Electricity Commissioners shall by order require the authorised undertakers to make such abatement from the rates and charges for electricity for the ensuing year that the estimated aggregate amount of the abatements will be as near as may be equal to the amount of such excess as aforesaid."

The duty of the Board will be to supply electricity to authorised undertakers, and the Bill is drafted to give it full powers to insist on the supply being taken. This will enable the generation of electricity throughout the country to be organised on lines which cannot be followed with the existing legislation. The latter was too parochial in character, but it has enabled the large corporations to deal effectively with the supply of electricity within the municipal boundaries. Mr. Chattock's undertaking is a case in point, but the Corporation of Birmingham cannot be expected to finance the supply in bulk to an indefinite surrounding district, the various parts of which can individually accept or refuse supply. The strength of the present Bill is the fact that the Board will deal with the country as a whole, and can prepare schemes on engineering lines with the assurance that the whole of the demands for electricity will eventually be handled. Under such a scheme the money now frequently spent on introducing inefficient plants will be saved. In my opinion the financial proposals of the Bill are a most important feature, and in no other way could this national scheme be quickly started. I gather that Mr. Chattock would prefer a partial scheme, to do in districts what the Bill proposes to do for the whole country. This would avoid, for the time, the expenditure for standardisation, but in the future this matter would have to be handled, and the cost then would be greater, as larger plant would then have to be altered.

The recent general strike gives a further reason for the adoption of this Bill, and for the generation of electricity being put in firmer hands. The majority of the undertakers continued to give a general supply and called in volunteers to replace the men on strike. There were other Corporations with Labour majorities who cut off supply during the day, and so shut down factories, the employés in which were all willing to work.

The Need for Accurate Costing—Why Wait?

A Suggestion for Speeding-up the Incipient Trade Improvement.

(COMMUNICATED.)

(*Concluded from page 910.*)

To write so much about the need for seeing that a day's work is obtained for a day's pay may seem to be making a long story of an obvious platitude, but it is nevertheless a truism that is more often neglected than acted upon. Were a little more attention paid to this measurement of services obtained for money spent, of work done for overtime wages paid—and there is room for more of it in some nine firms out of every ten—there would be heard much less of the outcry against high costs of production, and far greater attention would be devoted to reducing them. It is by means of such measurements that those who believe their costs are too high, can find out in what particular direction unnecessary expenses are being incurred.

If the necessity for providing some such means of measurement is clear, surely the power and possibilities of control that will be the natural outcome of the constant and careful application of such an instrument must be even clearer. The comparison of work done for wages paid (on day work as compared with piece work, for instance) not for the factory as a whole, which would be a mere average, but for each or any distinct department, or process or operation, or if need be for each man, must very quickly show where delays are taking place, or where time is being lost. Once the source of the trouble has been traced, the reason for its existence can quickly be discovered. It may be found that there is too much work in the shop for one crane to cope with, or there may be insufficient tools, so that men have to wait about till their fellows have finished with them, or lack of supervision may be shown to be the trouble. Loss of time and material may be due to a thousand and

one things, in many of which it is impossible to *see* a fault; only from defects of which they are the *cause* can their insufficiency be detected and made known.

The present age is always glad to hear about instances of slow production, not so as to provide an opportunity of "getting at" the men concerned, but rather to find out the reason for the delay, so that steps may be taken towards its removal. It is this means of measuring that provides the central agency for such news. Much has been heard recently of the need for a new spirit of co-operation in industry. Very often it is just these delays in production, once the management gets to know of them, that provide the opportunity for this new spirit to show itself, by having things put right to the mutual advantage of the workmen and the company.

A monumental example of what has already been done by applying this measuring stick, on an international scale, is to be found in the "Inquiry into Production," published (only in French) by the International Labour Bureau, at Geneva. Two extracts will be quoted:—"Owing to the improvements in methods of production in the steel-making industry of the U.S.A., whereas the number of workers in the industry in 1850 was 20,298, it has only increased in 1919 to 38,243, yet the tonnage production has gone up from 504,245 to 31,015,364. The number of workers is barely doubled, yet the production is 60 times greater."

"In 1921 the output per worker in the British cotton trade is given as only 50 per cent. of what it was in 1913."

These comparisons are, as has been said, measurements on an international scale, and though highly informative, are far less valuable for the purpose of showing where there is a possibility of cost reduction, and greater economy, than would have been similar comparisons for individual factories, or even sub-divisions of individual factories, but they do typify facts that matter in a business.

If, then, there be admitted the need for, and the advantages of, some such measuring instrument to compare services obtained for money spent, it remains but to show, in a more definite manner, how such means can be provided. This, fortunately, is not difficult if those who read have but the little foresight and enterprise necessary to make the experiment for themselves, and are prepared to shun rule-of-thumb methods as they would the plague.

As is truly, but very necessarily pointed out in this "Inquiry into Production," you cannot explain the facts, until you know the facts! Yet, how many directors of companies engaged in the manufacturing industries of this country are there who really do know the facts about all that is going on in the factories they control? There may be many good reasons and excuses why directors are not in the closest touch with every-day occurrences in their business, but there is absolutely no reason why they cannot have the fullest information about facts, both pleasant and unpleasant, which ought to be placed before them. If there is any waste or leakage not only of money, but of time, space, services, and material, then they can, if it be their desire, ensure that news of it reaches their ears. It is regrettable that the number of directors who arrange to be supplied with such information is not far greater than it is.

An instance may be cited to show what befell one board of directors who failed so to equip themselves. This refers to a large firm engaged in the manufacture of cast iron pipes. In 1920, when the price of pig iron reached a maximum of about £15 per ton, the cost of these pipes became so great that a price high enough to cover the calculated cost could no longer be obtained, and the firm began to search for some alternative and cheaper pipe to offer in its stead. After some deliberation, they decided to commence manufacturing welded pipes made from sheet steel. Though much cheaper than cast iron, great difficulty was experienced in persuading customers that the new pipes were equally suitable for the purpose required. Cast iron pipes had always been used for the purpose, and a change to some cheaper, but possibly inferior, alternative was not at first relished at all. Customers still wanted cast-iron pipes, but they wanted them at a lower price than that for which they could be made.

Very gradually, however, this conservatism was overcome, and the sale of welded sheet steel pipes began to increase. People began to find that not only were they equally as serviceable though cheaper, but they were also much lighter than cast iron, and more easily held in position. Bit by bit the fashion changed, until to-day the welded steel pipe is in universal demand, and it is the cast iron pipe that is hard to sell for this particular purpose. Now, however, the price of cast iron and sheet steel have both fallen far below the maximum figures reached in 1920, and to-day a good grade of foundry pig iron can be bought for about £3 10s. per ton instead of £15—the 1920 price. The result is that a complete reversal has been brought about, and now the cast-iron pipe is the cheaper from the manufacturing point of view.

In this firm, so much energy had been expended by the directors upon inducing customers to overcome their objections to the sheet steel pipe, and so concentrated was their attention on this one object, that the measuring stick had been lost or forgotten, and though they, of course, were aware of the fall in prices that had taken place, they were entirely oblivious to the re-adjustment in cost that had accompanied it. It was not until some entirely different reasons led them to have installed an up-to-date system of costing, that these directors became aware of the true state of affairs.

An accurate method of costing, specially designed to suit the trade, organisation and particular conditions of the firm concerned, is the means by which this "measuring" that has been referred to, can be maintained in continuous operation. If properly and intelligently made use of, there can be no doubt that all that has been claimed will be realised by this means.

Many people seem to regard costing as a job that can be entrusted to a few clerks, and that it is, at best, only useful as a rough guide to what it has cost to manufacture the products of the firm during the year. A firm of rope and twine manufacturers of some repute in the trade, make a practice of adding together the cost of their purchases of hemp, &c., their wages bills, and their works and office establishment charges, dividing by the total weight of rope made, and believing that they know their costs. This pernicious habit of self-deception is then flattered by them with the name, costing.

Comparatively few people believe that costing can ever give really accurate results, or supply figures that are more than partially reliable. Even fewer are apparently aware that costing can claim to provide other information than what it has cost to manufacture.

If a company gets into low water, that is, if its auditors are unable to bring out the balance of the profit and loss account on the right side, then the first to feel the effects of the wild and desperate rush to reduce staff that follows are the few hapless cost clerks. "We cannot possibly afford the luxury of costing in bad times like these." In arguing how and where to economise further, the last place to which they turn for help or guidance is their cost system, though, did they but know it, it is the one and only part of their office organisation that is capable of pointing out where and how economies and savings can be made; where, in other words, the least service in return for money paid out, is being obtained. The financial accounts can only provide the cold fact, long after the mischief has been done, that the year's trading has resulted in a loss; they are powerless to show how and where.

As Sir Edward Grey repeats in his "Memoirs," "It is precisely the man at the centre who is often unable to see the wood for the trees," and the truth of this is always much in evidence immediately after the presentation of an adverse report by the auditors. In the haste to prevent a repetition at the end of the current year, already partly spent, the axe is wielded in a manner so ruthless, and the disturbance caused is so great, that often it is the really useful and necessary people that are hastily discharged, and the last state is worse than the first. The only way in which this affliction of the vision, which so often attacks responsible men at such times, can be guarded against, is to don the spectacles

provided by the cost system. By this means a clear insight into the workings of the business can be quickly and easily obtained.

Cost systems are often condemned and disregarded because they have this fault (though it can hardly be said to be the fault of costing), and that is that they are left in the hands of a few clerks. The cashier or perhaps the secretary of the firm may be nominally in charge of them, but these officials have their own allotted duties to perform, and little time to devote to costing, which is not their proper work, so it often receives neither their interest nor their best attention, even if they have the necessary knowledge of the subject to make a success of it, and this is but rarely the case. Inevitably, the cost results presented under such conditions are nothing but the work of a few clerks. The results may be correct, but they are not brought out or expressed in such a way that important and useful features will inevitably catch the eye of the directors concerned, even if they do happen to look at them at all.

Costing, like everything else, must be properly supervised if it is to be of any value. Clerks working on their own cannot be expected to produce this finish, which makes all the difference between a page of figures and really helpful and valuable statistical information. For one thing they are seldom in sufficiently close contact with the directors to know their policies, and what will help and interest them in endeavouring to carry them out. For another, if they could produce "finished" work, they would no longer remain clerks.

Costing is now rapidly becoming a separate and distinct science of its own. It is not accountancy, and it is not economics, but something between the two, and yet different from either. What really matters in the training of a specialist in costing is practical knowledge of the manufacturing process which he has to cost. Costing is primarily a shop problem. The greatest benefit is derived from its ability to help the shops to produce more economically and more cheaply, to help them to choose, not the machine that will produce the quickest, but the machine that will produce the cheapest; two things which are by no means always synonymous.

Though a little costing is now included in the syllabus of training of a chartered accountant, the majority of accountants realise and admit their inability to tackle costing problems, because they have had no opportunity of studying "shop practice." The wisest of them consequently leave costing to those who have made a special study of the subject, and have had the essential advantage of practical experience in the shops.

To such people, manufacturers who believe that their foundry costs, or their by-product costs, for example, or their selling costs ought to be less, will be well advised to turn for guidance in these matters.

The Royal Society's Soirée.

Annual Exhibition and Demonstrations.

THE Royal Society's annual conversazione was held at Burlington House, London, on June 16th. Sir Ernest Rutherford, O.M., president, welcomed Fellows and guests, and the usual scientific exhibits and demonstrations had been arranged; though they were not so numerous as in past years, they totalled 33, several of an electrical nature being amongst them.

Mr. W. M. MORDEY conducted some experiments of considerable interest, which demonstrated a strong rotation in multiphase fields of magnetic materials which are either non-conducting in themselves, or are made so by being reduced to powder and mixed with glue, or shellac, which electrically separates the particles from one another. Disks or cylinders of such materials were used, including magnetite, pyrrhotite, nickel, hard cast iron and hard steel grit. In such substances no appreciable eddy currents are produced, but they form induction rotors with no windings and no induced currents. The rotation, which is attributed to hysteresis only, is in the same direction as that of metal disks or cylinders placed in the same magnetic fields; loose powders of the same magnetic materials rotate in the opposite direction. No movement takes place either with moulded disks or with loose powders of non-magnetic metals, such as copper or aluminium, showing that no appreciable eddy currents are produced in powders even of good conducting substances.

Mr. A. C. DOWNING'S electrical instruments for physiological research included a simplified moving-magnet galvanometer of great sensitivity and short period, with a very light magnet system and a "mumetal" shield (Gutta Percha Co., strip wound alternately with copper and annealed at 900 deg. C. in nitrogen), which is claimed to cut out 99.9 per cent. of the external magnetic fields. He also showed thermopiles for measuring the heat production of muscle and nerve and, with Dr. Anrep, apparatus employing a hot wire for measuring the velocity of the flow of blood from a vessel during a single cardiac cycle. The hot wire wound on a thermopile used for measuring the strength of stimulus, or for "calibration," will measure 20 microamperes a.c. to less than 1 per cent.

Studies of radio-telegraphic atmospherics were the subject of the Radio Research Station's exhibit, in collaboration with Prof. E. V. APPLETON. A method of examining the wave-form of transient electrical impulses, involving the use of linear and unambiguous time-base with the cathode-ray oscillograph, was shown in actual application to the visual observation of atmospherics received on a local antenna; the nature of the time-base e.m.f. was separately demonstrated. Records of typical wave-forms of atmospherics observed in the tropics were on view, together with records of their direction of arrival and of the meteorological environment of their sources.

Dr. W. H. ECCLES, F.R.S., and Dr. WINIFRED LEYSHON showed a neon tube and tuning fork combination for producing electrical oscillations of harmonic frequencies suitable for calibrating wave-meters. When a neon tube is connected in parallel with a condenser and in series with a resistance and a battery, an intermittent luminous discharge passes through the tube as was shown by Pearson and Anson. In the exhibit such currents were passed through the coils of an electromagnet so as to keep a steel tuning fork in continuous vibration. For this purpose the electrical constants must be chosen so that the intermittent discharges have the same frequency as the natural frequency of the fork, and then the fork will react on the circuit and compel accurate isochronism. The current in such a circuit has many high harmonics, and, therefore, induces an oscillatory current of any chosen harmonic frequency in a neighbouring circuit tuned to that frequency.

Sir ROBERT HADFIELD, F.R.S., exhibited sample alloy steels for various special purposes, including specimens specially suitable where great resistance is required to withstand the effect of temperatures of from 800 to 1,000 deg. C.

A rotor with wheel, blades, and shaft machined from one piece of "ERA/ATV" steel was shown as used in the construction of exhaust-gas turbines. These rotors are driven by the exhaust gases from internal-combustion engines; they work continuously at a temperature of from about 800 to 950 deg. C., and run up to the very high testing speed of 53,000 revolutions and working speeds of about 30,000 revolutions per minute. These special steels possess not only a high resistance to

the corrosive and erosive effects of very hot gases, but also great mechanical strength even at a bright red heat, enabling parts made from this material to withstand exceedingly high centrifugal and other stresses.

A tuning fork of high nickel chromium alloy steel, with constant frequency at varying temperature was on view, the necessary characteristic of the material for such a purpose being a very low temperature coefficient of the modulus of elasticity.

The Clarendon Laboratory, Oxford, exhibited a photoelectric photometer (Prof. F. A. LINDEMANN, F.R.S., and Dr. G. M. B. DOBSON) built on the principle that two beams of light from an electric filament lamp traverse two different, but similar, paths and finally both fall on one photoelectric cell. A shutter allows one or other of the beams to be cut off; at one point the beams are brought to a focus, and the photographic plate to be measured is placed on a mechanical stage so that the focus falls exactly on the film. The second beam passes through an adjustable optical wedge, which is moved until the electrometer connected to the photoelectric cell shows the same deflection whichever path the light is traversing. The reading of the wedge gives a measure of the density, and in this way the density of very small areas, such as spectral lines, can be measured and high accuracy can be obtained, an accuracy of 1/10 of 1 per cent. being easily attainable.

The physical laboratories, Victoria University, Manchester, showed some ingenious models of crystal structure (Prof. W. L. BRAGG, F.R.S., Mr. G. B. BROWN, Mr. J. WEST). Crystals of BeO, of Al_2O_3, and of $BeAl_2O_4$ are very different in form, but a comparison of their structures has shown that the relative positions of the oxygen atoms are almost identical in all three. The shape of the structure appears to be determined by the large oxygen atoms, the metal atoms being inserted into the spaces between. The structure of the typical orthosilicates, olivine (Mg_2SiO_4) and monticellite ($MgCaSiO_4$), are exactly like that of $BeAl_2$, O_4, while beryl ($Be_3Al_2Si_6O_{18}$) is another interesting example of a silicate with a simple structure. Photographs showed B-ray tracks associated with absorbed and scattered X-rays (Mr. J. M. NUTTALL and Mr. E. J. WILLIAMS) produced in a gas by a beam of homogeneous X-rays in a Wilson cloud chamber. The long tracks are due to electrons ejected from atoms which have absorbed a quantum of the incident X-rays; the short tracks are supposed by Wilson and Crompton to be due to this scattering of a quantum. A large number of photographs has made it possible to find accurately the relative numbers of these two types of track for different gases and wave-lengths. Mr. A. J. BRADLEY indicated the structure of "β" manganese and "γ" brass.

In Mr. W. A. DOUGLAS RUDGE'S mechanical models, which illustrate the structure of the atom, the electron is represented either by a small rapidly-rotating electric lamp, or by the negative glow of a vacuum tube. In the first form the lamp is rotated simultaneously about two axes at right angles to each other; a continuous line of light, by persistence of vision, is thus traced, cutting off a more or less spherical space, representing the envelope of the atom; the nucleus is represented by another lamp at the centre of the system. In the vacuum tube model, a system of tubes is so rotated that the anode glows are concentrated at the centre, forming the nucleus, whilst the cathode glows are distributed in the space outside.

The apparatus of Prof. O. W. RICHARDSON, F.R.S., for the investigation of soft X-rays consists of a tube in which very soft X-rays, varying in wave-length from about 20 to 400 Angstrom units, are produced by the electronic bombardment of solids; the tube is of transparent silica and is highly exhausted to a pressure of about one ten-millionth of a millimetre of mercury. The presence of the X-radiation was demonstrated by the photoelectric emission which it produces from a copper plate enclosed in the tube, the photoelectric current being detected by an electroscope. Diagrams showed the results of the excitation of characteristic X-rays and other effects at certain critical voltages, contrasting some of the properties of ordinary and soft X-rays.

The ROYAL ARSENAL, Woolwich, research department's display consisted of radiographs of general interest, showing, amongst other things, penetration of 4.5 in. of steel.

Dr. J. S. OWEN'S bore-hole alignment indicator was designed to guard against the fact that deep boreholes, driven by rotary drills, may deviate greatly from the vertical without the drillers being aware of the fact. To find the true direction a clinometer and magnetic compass, together with a clock, a contact-making drum, a battery and lamps, are enclosed in a brass tube about 4 ft. long, which is capable of withstanding considerable water pressure. The instrument operates in vertical, horizontal, or inclined holes, and the records are made at pre-determined intervals of time on strips of sensitised paper.

The METEOROLOGICAL OFFICE'S exhibit was concerned with the methods of measuring solar radiation, one of them being the use of a Gorczynsky pyrheliometer, which records direct solar radiation as it is made to fall on a Moll thermopile connected with a recording millivoltmeter; to avoid friction the pen is free, but is automatically pressed against the paper at short intervals.

Low-Pressure Distribution.

Some Particulars of a New Design of Network Box.

By L. R. LEE.

THE distribution of electrical energy at its final consumers' pressure, particularly over dense cable networks and in large towns, has never been the easiest problem with which mains engineers have had to deal. Electrically, the distribution of d.c. is more difficult than that of a.c. owing to well-known natural phenomena acting adversely with the former, but granting that the electrical troubles have been and can be largely overcome by good design and careful installation, there still remain other troubles—largely mechanical—to be surmounted, some of which are incidental to the type of distribution-point unit adopted. Generally, it may be said that most networks are fitted with distribution points or units either in the form of above-ground pillars or underground boxes. In any case, the distribution unit is perhaps first of all called upon to provide efficient and quick action during fault times; that is to say, a fault having occurred, it is very desirable that discrimination between faulty and good cables should be automatically obtainable at the distribution point, and that the unit should lend itself easily to getting supplies going again with the minimum of delay. Agreeing that this is the correct suggestion, and that any fault should be so confined as to affect the smallest number of consumers, it follows that it is not correct practice to make what are known as solid tee joints on the distributors. On the contrary, each distributor should, as far as possible, be brought back to some well-defined distribution point, and there attached to other distributors and possibly to a feeder. If at this point each

distributor can be supplied through a thoroughly efficient cut-off, so much the better.

It will probably be agreed that until very recently, no really reliable cut-off capable of being used in the confined spaces left for a mains engineer's use in the crowded streets of our towns was obtainable, and therefore the existing best arrangement appears to be that, as far as possible, feeders are kept separate at their network ends and fitted with automatic circuit breakers at their station ends, the distributors forming open-ended branches from the feeder, being coupled to it through some solid form of connection, and thus, in case of fault, the whole tree—non-faulty as well as faulty distributors—is shut down. It now appears, however, that the above conception of the best method is seriously altered by the fuse lately perfected by Mr. Vernon Hope,

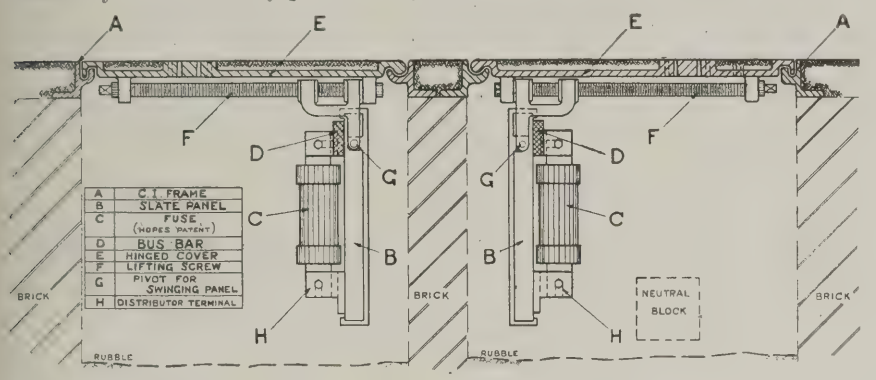


Fig. 1.—A 3-pole D.C. Distribution Box.

and by its use the writer suggests that it may be easily possible, not only to link together feeder and feeder to a reasonable extent at their network ends, but also to provide each distributor with a really reliable discriminating cut-off. Whatever be the method adopted, however, for ensuring continuity of supply to the greatest number of feeders, we have finally to decide on the type of distribution unit to be employed in the streets.

At the moment, the above-ground pillar has certainly appeared to find most favour, because operation at the distributor ends is so easily accomplished, but its great drawbacks are: (1) As it must be placed at the curb-edge of the footpath, it is frequently being knocked down by skidding motor lorries, thus resulting in heavy short circuits and the cutting-off of supplies to large numbers of consumers; (2) that the cable work in the bottom of the pillar is very congested and most difficult to get at; and (3) that some supply companies are unable to obtain permission to erect overground pillars from the road authorities in whose towns they operate.

With regard to underground network boxes, they are divided into at least two classes: (*a*) Those in which the electrical unit is erected in a more or less spacious underground chamber; and (*b*) those installed as cast-iron boxes, containing the electrical terminals, fuses, links and bus-bars mounted on an insulating base plate—forming a horizontal switchboard of small dimensions and horrible possibilities. One need only look at a drawing of one of these boxes to see what the possibilities are; for instance, when it is required to connect up all three (or four) poles of a feeder, and, say, four sets of multi-core distributor cables.

Summing up the troubles and disadvantages of underground boxes, we may say they are: In the case of (*a*), the necessity of a very costly drain connection to the sewer, the undesirability of jointers' work being done so far below the ground, the difficulty of adequate ventilation, and the very great overall cost owing to size; in the case of (*b*), we have the probability of short circuits occurring when connecting up and whilst in use, the troubles caused by condensation inside the box—the water finding its way below the compound level to the insulating base, the great difficulty of connecting new cables, and the trouble of lifting the lids when they have been in use for some time, owing to the oxidation of the jointing material between the lid and the box. And again, during working, if it is desired to withdraw the links or fuses, the operation has to be done below the street level and the operator's feet. When installing this type of box, the practice usually adopted is to put in short lengths of cables to fill up all the ways and to make straight joints on the cables outside the box, thus actually putting an extra joint on each cable. From the above it would appear to be distinctly advantageous if the best points of both the overground pillars and the underground boxes could be combined in one and the same unit, and the disadvantages of both eliminated.

The result of the writer's attempt to put an overground unit below the ground and to bring an underground unit above the ground so that the electrical gear may be in either place as and when required is shown by the accompanying illustrations. The designs have been made so that the "Hope" fuse, which should preferably be used in a vertical position, can be employed; but, of course, they permit the use of any other form of fuse or link.

Fig. 1 shows the design for a 3-pole d.c. unit distributing 2,000 amps. in four circuits, and the total space required for its installation is about 20 cubic feet, the depth of the containing pit being only 2 ft. Each pole—positive and negative—is, as shown, on a separate panel, whilst the neutral terminal block is separately affixed to one of the walls of the containing pit. For operation purposes—renewal of fuses or disconnection of a cable—the hinged street-leved lid E, from which the fuse panel is hung at point G, is raised to a vertical position on its hinge, and in doing so, the fuse panel is brought slightly above street level, and by virtue of the pivot at G maintains a vertical position. Further raising of the panel to a position wholly above street level is accomplished by revolving the screw F. Although the two charged panels are shown in the drawing back to back and close to one another, one pole may be much more removed from the other if desired. In fact, one pole could be in one street and the other round the corner in another street, the neutral block being in either containing pit; or, if desired, the panels could be arranged face to face in the same containing pit without the brick division wall shown.

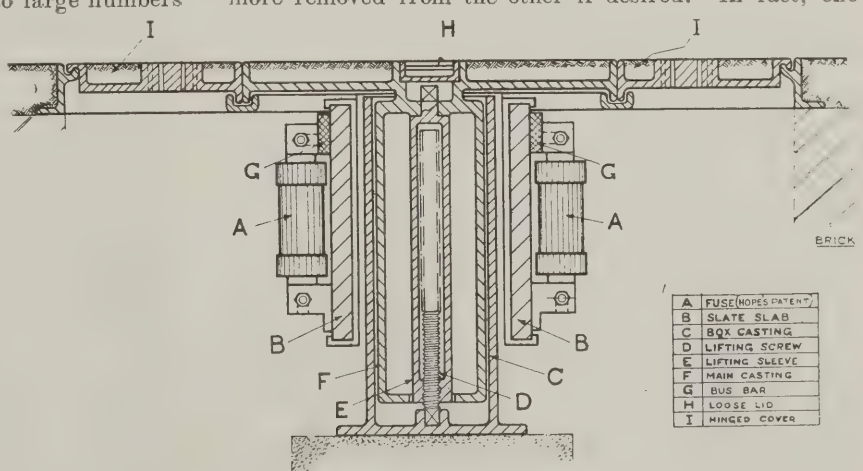

Fig. 2.—A 2,000-Ampere Distribution Box.

Fig. 2 shows a unit for distributing the same amount of energy as in the case of fig. 1, but here both charged panels and the neutral terminal block are mounted on a central support, so that if the lifting sleeve E is revolved at H, the whole mounting is raised above street level, bringing the fuse and terminal panels into a position above ground. The cubic space required for this design for

a d.c. unit is about equal to that required for the other design.

In both cases, the upward movement of the panels is permitted by the use of standard flexible cables connected between the tail-end box of the underground cable and the distributor terminal at the lower end of each fuse (or link). If the unit is also to be used as a feeder point, the feeder flexibles would be attached directly to the bus-bar shown in each case, and such feeder copper should perhaps be divided into two half section cables so that one half could be attached to each end of the bus-bar.

Supposing that the distribution is for a.c. circuits, then in the case of fig. 2, the third charged panel would be placed on the square central mounting opposite the neutral block, whilst in the swinging-panel design, a third containing pit would be required. It may be mentioned that the small street covers I in fig. 2 are suggested simply for the easy examination of the pits by the "box inspectors." The central cover rises with the electrical gear when the screw sleeve E is revolved.

The claims made for the new designs are: Simplicity; all the advantages of an overground pillar; no abnormal obstruction of the footpaths; entire freedom from short circuits; owing to the small depth of ground pit required, there is no necessity for drain to the sewer, as the gear would be well above the normal ground water level, the street-level frame being drained to the curb-edge; water troubles through condensation are non-existent because of the ease of ventilation and freedom from gas accumulation; their suitability generally for power distribution and for street lighting terminal boxes, for tramway and railway section dividers and feeder points, and for use in docks and all places where it is desirable to have unobstructed floors and gangways —designed on smaller lines, the gear can be adapted for wall or floor boxes in mills and like places; and the small space required for the distribution of comparatively large loads, thus cutting down the costs of installation.

It may interest readers to learn that application for the necessary letters patent for the new designs has been made.

Practical Experimental Work.

The Scientific Organisation of Procedure in Research.

By W. R. NEEDHAM.

IT is not every works which has an elaborately fitted research laboratory. Indeed, it is very few which have any laboratory at all, whether fitted elaborately or otherwise. At the same time, however, it would astonish many to know really how much experimental work is undertaken by small as well as large concerns. Such efforts may not be on any imposing scale, and yet may quite logically be classed as research work.

Most men with any experience worthy the name can recall times when something has gone wrong, and it has been up to them to worry out expedients or preferably discover remedies. In many instances this has involved days and days spent on the machinery itself, trying now one device, now another, until at last things have been so adjusted that normal functioning has been secured. This is no uncommon occurrence. Many men hate such a break as this occasions in the ordinary run of their work. Unless, however, it has all arisen by reason of some carelessness for which they are themselves responsible, they do far better to welcome these incidents as providing opportunity for finding out something very well worth while. In any case, very much depends upon the spirit or temper, and the mentality, of those who take matters in hand. The man who is all nerves and funks the whole job cannot in general be expected to succeed brilliantly. Of course, he may be a sticker, and fighting down his apprehensions really make good. Usually he isn't, and often his stage fright is not altogether unassociated with paucity in mental equipment for the task. Such chances may provide opportunity not available otherwise; they do offer scope in many instances for initiative and the garnering of valuable data. Where the results are other than expected, they are not necessarily on that account unimportant. As a matter of fact, what is dubbed a negative or dud result, may be far more instructive and useful than one in strict accordance with the experimenter's wish or preconception. In a very real sense there are no negative results. Once a man becomes at home in such work, he will be quite happy to observe what happens. He will then record what *does* happen. He will have overcome the novice's temptation (none the less real, because half involuntary) to jot down what he deems to be favourable and omit what he thinks otherwise. He will take care to make his notes impersonal, impartial. The true experimenter does not take sides. He is a reporter, not an advocate. Then afterwards he marshals his facts and deduces his laws, and is the better equipped to understand the real trend of things, to interpret the true meaning of the experiments he has undertaken. Thus, and thus only, can he hope to carry on and probe deeper. It may seem the longer way round. It is the truly scientific way. Often, even in apparently simple experiments, there is no short cut through. They who make a big splash sometimes do not get far. They may console themselves thinking they have won at a stroke, where others have failed at great length. Too frequently their remedies are hopeless quacks, and later the real doctor has to be called in.

It is obviously impossible to lay down hard and fast rules. Procedure varies to a large extent, according to circumstances. At the same time, however, there are certain broad and general considerations which are not unimportant. They assist one to get to grips. The more particular details are then all the more readily and logically attended to.

The present contribution closes with a brief discussion of these desiderata.

1. The person directly interested should either himself undertake and father the experiments, or else he should keep in close touch with the work.

It is always well to remember that however conscientious and painstaking a deputy may be, he cannot be expected, in the ordinary course of events, to understand fully the inwardness of things. Generally speaking, he will do what he is told to do, will work more or less closely to programme. But he will not carry out the whole in an altogether satisfactory manner. For him to do this, he needs instruction not merely in procedure, but more than anything else he needs to know what it is all about, and what it is for.

Thus if such work must be put in the hands of assistants, they should be given freedom of the facts; and the assistants chosen should be proven men, who can enter into the spirit of the enterprise. Good results cannot be expected unless the experimenter's interest is whetted and his zest awakened.

2. When determining the range and scope of tests, it is extremely advisable that careful thought be given to the subject. It should be studied from several angles. The kind of questions one asks one's self include:—

(*a*) What is it the experiments are to reveal?

(*b*) Is the problem one involving a few or many factors?

(*c*) How can one be reasonably sure the ground is really covered?

(*d*) What are the actual data sought?

(e) What readings and records are necessary? How many subsidiary details must be noted?

It is most annoying to find later that interpretation is obscured by reason of gaps in the records. A series of tests may have been taken, and the test sheets issued, and then it be found that certain highly important items have been overlooked during the tests. It is better to think beforehand than regret afterwards. In any case, the preliminary records should be in the hands of the responsible party before the apparatus has been dismantled. In this way, though the best may not have been secured, the worst may yet be avoided.

3. Having thought out the scheme, it should be translated into the black and white of definite instructions. A chart of procedure, carefully arranged, and fully informing, should be drawn up. It should embody the salient features and also the subsidiary particulars required.

Only the man really in the know is qualified to undertake this most necessary drafting of the plan of operations. He does well to supplement the written instruction with verbal explanation, preferably on the job itself. He cannot exonerate himself from blame unless he makes sure that those carrying out his orders really know what those orders are.

The more important the research is, the more necessary it is for him to nurse it well. His interest will stimulate that of those who assist him. Keen men become keen when they realise the importance of the work they do, and specially so when they truly grasp the hang of things. His frequent presence and keenness count for more than he probably realises.

4. As the experimental work proceeds, it is eminently desirable that one should keep constantly on the lookout for developments in the work itself.

Often enough it happens that results are being recorded which surprise the observer. They run counter to his predilections. It may thus be very advisable to modify one's original scheme in order to ensure that the real nature of the development be recorded. This in turn may suggest hopeful investigation along what would at first sight have appeared a side track.

This kind of experience has been fairly common to the workers in pure as distinct from applied science. Much of the success which has been won by these less trammelled pioneers has met them when they have turned aside to follow whither the trail has led.

It is essential that the experimenter be keen to observe just what happens, and as keen to trek where the scent draws him. The obstinate man, the prejudiced man, is useless in the pursuit of either pure or applied science; and experiments really have no meaning for him. His eyes are open for the phenomena which appear to support his theory; and he is blind to all else. In science and in its application to engineering, he is a drag, often a menace.

The writer is convinced he does well to urge these matters. He has several times been unable to reach a definite conclusion because tests which were supposed to be fully informing, omitted just the data which would have supplied the defect.

The plain fact is that often too little thought is given to the real object of the experiments; and thus only partial information is forthcoming. These things ought not to be. They need not be.

To mention one point only. Were adequate readings made, and records digested and analysed, how much more definite information we might have on the still somewhat obscure and very involved subject of lubrication. Tests are taken of all classes of commercial machines, many with oil ring bearings, many with flow lubrication. Exactly where is the zone of demarcation? It is not a wide zone. When is water cooling or oil cooling necessary? Usually we rely upon deductions from laboratory experiments carried out by eminent physicists on small bearings. Here, however, at the different works the very material is at hand. It ought to be readily possible to get a closer answer than needs must at present satisfy many engineers. Here surely is an excellent opportunity for putting theory to a fairly thorough test.

The Foundry Trades Exhibition.

Some Electrical Exhibits.

DUE no doubt to the present restricted train services, the number of exhibitors at the International Foundry and Allied Trades Exhibition, which was held at the Royal Agricultural Hall, London, N., from June 10th to 19th, was considerably short of what is usual. In spite of that, the exhibition was fairly well patronised, and the exhibits proved attractive, and a few of these were of interest to electrical people. The FOSTER INSTRUMENT CO. and the BOWEN INSTRUMENT CO. each had an interesting display of electrical pyrometers. The former company showed its new "Fixed Focus" radiator pyrometer, a "total radiation" type of instrument which is purely automatic in action. It is fitted with a patented removable window at the centre of the receiving tube to protect the sensitive part of the apparatus from damage by fumes and dust. The tube is also provided with ventilation openings, a diaphragm to prevent the entrance of stray radiation, and a special sighting device to facilitate accurate pointing. Among the other exhibits by this firm were the "Dial" recorder, which operates by producing a chain of dots by means of a carbon-paper sheet underneath a translucent circular chart; and a power-plant pyrometer, which has a concentric form of thermo-couple, in which the actual hot-junction is directly exposed to the temperature to be measured. Included in the range of pyrometric instruments by the Bowden Co. was a series of radiation instruments of which the "Pyro" was particularly interesting. In this instrument the radiation from the source of heat is received on a lens, which concentrates the radiant energy on a small thermocouple. A portable type of this instrument contains the optical system, the thermocouple, and the indicator complete in one unit weighing only 25 ounces and measuring 7 in. long by 4⅜ in. in diameter The instrument is provided with a wooden carrying case and shoulder strap. For permanent installations the "Pyro Tube" is offered for connection by an external cable to either an indicator or a recorder, and a number of these tubes may be attached to the same instrument for multiple-station equipments.

Messrs. S. WOLF & CO., LTD., made a special display of electric tools, including drilling and grinding machines. A portable stone-grinding and polishing machine which was exhibited is the latest addition to this firm's products. The driving motor is mounted on a base (on wheels), which also carries an upright which supports the driving end of a flexible shaft; this is belt-driven from the motor. The flexible shaft enables a wide range of work to be done, including moulding, sawing, bevelling, and polishing. A water tank is mounted at the head of the upright, a suitable tube from this enabling wet grinding to be done.

Among a selection of air compressors shown by Messrs. BROOM & WADE, LTD., was a 2-cylinder "Broomwade" directly coupled to and mounted on a common bedplate with a 25-h.p. driving motor. This machine will give an output of 130 cu. ft. of free air per min. at 100 lb. per sq. in.

Some interesting magnetic separating machines were seen on the stand of the RAPID MAGNETTING MACHINE CO., LTD. A patent combined sand sifter and magnetic separator was employed on the regeneration of used moulders' sand. The working part of the machine is a slightly-tilted horizontal revolving drum through which the mixture travels. The upper and major portion of the drum is a sieve, which discharges the pure sand; the splashings, &c., are attracted to the magnetising end at the bottom of the drum.

A portable electric sand riddle was exhibited by Messrs. JOHN MACDONALD & CO. This machine carries the sieve on a projecting arm and operates it in an elliptical motion with the necessary "kick" required in such a machine. The ¼-h.p. driving motor and the crank gearing are entirely enclosed and thoroughly protected from the sand. The whole is mounted on three legs, one supplied with a roller, enabling the machine to be moved about as with a wheelbarrow.

Messrs. JAMES KEITH & BLACKMAN CO., LTD., showed a newly-designed dust and grit separator for the removal of grit from flue gases. In this device the separator and fan are arranged as a single unit.

The TURBINE FURNACE CO., LTD., exhibited the "Vulcan" boiler tube and flue cleaner. It is steam operated and is equipped with up to 5 or 6 parts for the steam outlets to the required parts of the boiler. The ports are governed so that only one is open at a time, the last port being automatically closed as the next one is opened.

A special non-commercial and technical portion of the exhibition was organised to show something of the research carried on in the industry (foundry), its history, apparatus available for the scientific control of processes, and a survey of some of the raw materials used. A number of special furnaces were seen on the stand of the NATIONAL PHYSICAL LABORATORY, including a high-frequency induction furnace suitable for 20-lb. melts of iron or copper alloys. The Research Department, Woolwich, showed some of the applications of X-rays for the examination of metal castings and forgings. By means of one set of equipment it is possible to take a radiograph through over 4 in. of steel and to reveal an internal hole of ⅛ in. diameter in the centre of the specimen. The Universities of Sheffield and Birmingham, the British Non-Ferrous Metals Research Association, and the British Cast-Iron Research Association also exhibited.

D

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index to Vol. XCVIII (for the half-year ending June 30th, 1926) will be published shortly, and we shall be glad to receive the names and addresses of those who require it (free of charge) for binding purposes or wish to retain it for reference. Application should be made at once to the Publisher, 4, Ludgate Hill, E.C.

Company Law Amendment.—A lecture traversing the report of the Company Law Amendment Committee was given on June 16th by Mr. Herbert W. Jordan, under the auspices of the Incorporated Secretaries' Association, to members of that body and representatives of the banking and accountancy professions.

Trade with Newfoundland.—In a report to the Department of Overseas Trade (Stationery Office, 2s. 3d. net) Mr. F. W. Field, Senior Trade Commissioner in Canada and Newfoundland, states that the colony's trade is in a position which indicates that an improvement might be made so far as the United Kingdom is concerned. In 1923-24 the total imports of Newfoundland were valued at $27,677,182; of this Canada supplied $11,569,434, the United States $8,589,290, and the United Kingdom $6,250,360. In the succeeding year, however, of a total of $36,404,674, Canada's share was $13,759,788, that of Great Britain $11,357,585, and that of the United States $9,976,292. The merchant firms of St. John's are an important factor in import trade. The people of Newfoundland do not approve of the appointment by British firms of agents in Canada to attend to business in Newfoundland.

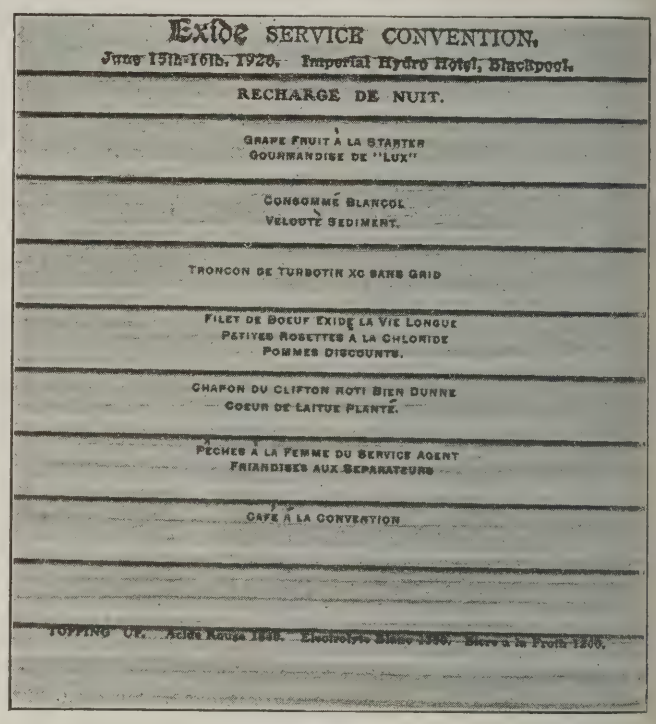
Newfoundland Tariff Changes.—The *Board of Trade Journal* publishes a list of alterations in the Newfoundland customs tariff which took effect on May 19th last. Among the goods affected are steam engines, i.c. engines, electric generators and motors, air compressors and steam boilers for use in connection with mining machinery, which are to be admitted free of duty; radio "machines" and apparatus which are subject to an *ad valorem* impost of 50 per cent.; and welding outfits which will pay 35 per cent. *ad valorem*.

The Registration of Contractors.—At the last meeting of the Executive Committee of the National Register of Installation Contractors the following were accepted, while 11 applications were refused and one was withdrawn :—

Carwin Electrical Co., Preston
Mulligan Bros., Dublin
Webb & Co., Birmingham
Spouge, C. R., Lincoln
Rayton, S., & Co., Leeds
Patterson, R. H., Jesmond, Newcastle-on-Tyne
Brightside Foundry & Engineering Co., Ltd., Birmingham
McCall, W. A., Blackburn
Milner, E. H., High Wycombe
Teesdale & Jones, Swindon
Carr, Harold, Leeds
Davidson, Taylor & Co., Sunderland
Smerdon, T. H., N.W.5
Parker, Winder & Achurch, Ltd., Birmingham
Birch & Evans, Walsall
Cross, G. & A. J., Tunbridge Wells
Brady, G., & Co., Manchester
Sigsworth, A. B., & Co., South Shields
Saunders, H., & Son, Horsham
Fletcher & Thurley, Manchester
Warburton, W., & Co., Ltd., Halifax
Smith, W., & Son, Weymouth
Dudley, C., & Co., Blyth
Kent, F., Clonmel, Tipperary
Phillips, H. S., Weston-super-Mare
Riddels, Ltd., Belfast
Stoves, L., South Shields
Thomas, A. J., Newton Abbot
York Corporation Electricity Department
Beckenham Urban District Council Electricity Department

Telephone Apparatus Contracts.—The Sterling Telephone and Electric Co., Ltd., informs us that it has recently received a number of important overseas contracts, including one valued at about £80,000 from the Commonwealth of Australia for telephone switchboards, one for switchboards from the Union of South Africa, and another for wall and pedestal telephones and switchboards from Argentina.

Swedish Electrical Exports.—The *Swedish Economic Review* (the official organ of the Swedish Board of Trade) states that during the first four months of the current year electrical machines to the value of 8,277,000 kr. and telegraph and telephone apparatus valued at 1,650,000 kr. were exported from Sweden. In the corresponding period of 1925 the figures were 4,700,000 kr. and 1,962,000 kr. respectively.



Difficulties of the Swedish Market.—In the course of a report on this subject a representative of the Federation of British Industries says that British manufacturers endeavouring to obtain a footing in the Swedish market should class Sweden as a manufacturing country. In all engineering matters Sweden plays a leading part and has an established position in this industry. It is true that certain lines of British products will always find a sale, but, generally speaking, Sweden is determined to manufacture as much and import as little as she can, and in this policy she has the assistance of a protective tariff on goods which can be manufactured locally. A country where the currency has remained steady for several years has obvious attractions for the foreign exporter, and it is probably a fact that Sweden, in comparison with the extent of her purchasing power, has had more offers of foreign agencies than any country in Europe.

Household Appliances.—A Household Appliances Section of the London Chamber of Commerce is being formed. At a luncheon to be held at the Holborn Restaurant on Monday, July 12th, Mr. F. W. Goodenough will deliver an address on "The Advantages of Co-operation in the Household Appliances Industry."

Adhesive Tape.—Messrs. A. H. Hunt, Ltd., have sent us three samples of their adhesive insulating tape. Two of the samples are in tins of different sizes; the third is wrapped in tinfoil. The tape is supplied in attractive cartons in four colours for counter displays.

Foreign Orders for Germany.—The *Deutsche Bergwerks Zeitung* learns from Helsingfors that as a result of the public adjudication for the supply of electrical cables and insulators to be used in the construction of the largest water power works in Eastern Europe, on the Imatra waterfall, the Finnish State Water Power Commission has placed large orders with the German electro-technical industry. The German telephone works have received fairly large orders for telephones, and contracts for the supply of insulators and cables have been signed with the Brown, Boveri Company, the Gutehoffnungshütte A.G. and the Hermsdorf-Schomburg Isolatoren G.m.b.H.—*Reuter's Trade Service* (Essen).

An "Exide" Convention.—Last week the annual convention of "Exide" battery service agents was held at Blackpool, when there was an attendance of about 200. The meetings were held in the large ballroom of the Imperial Hydro and the subjects discussed included developments of new designs, regulations affecting battery workshops, new and improved methods of charging batteries, &c. It is claimed by the Chloride Electrical Storage Co., Ltd., that these conventions prove of real value to a great proportion of the general public. The annual dinner was held on June 15th. A novel and apposite menu was provided, printed on wood separators. One of these is depicted herewith.

Exide SERVICE CONVENTION.
June 15th-16th, 1926. Imperial Hydro Hotel, Blackpool.
RECHARGE DE NUIT.
Grape Fruit à la Starter
Gourmandise de "Lux"
Consommé Blancol
Velouté Sediment.
Tronçon de Turbotin XC sans Grid
Filet de Boeuf Exide la Vie Longue
Pétives Rosettes à la Chloride
Pommes Discounts.
Chapon du Clifton Roti Bien Dunne
Coeur de Laitue Plenté.
Pêches à la Femme du Service Agent
Friandises aux Separateurs
Café à la Convention
TOPPING UP. Acide Range 1240. Electrolyte Blend 1300. Brew a la Profit 1200.

A Novel "Exide" Menu Card.

Employment during May.—Employment in the engineering industry during May was very bad, being seriously affected by the general strike and the coal stoppage. The general average of unemployment throughout the industry rose from 10.4 per cent. in April to 15.8 per cent. The electrical engineering branch was badly hit, the figure in this case rising from 6.6 to 10.6 per cent. The electrical wiring and contracting industry showed an unemployment figure of 10.3 per cent., as compared with 9.1 per cent. in April, although the figure was better than in May, 1924, when it was 13.3 per cent. The percentage of unemployed in the electrical cable, wire, and electric lamp manufacturing group rose from 6.5 to 9.6.

Lead.—Reporting on June 19th, Messrs. James Forster and Co. stated: "Consumers in this country, owing to the importation of large quantities of foreign coal, are now obtaining their full supplies of fuel, and are therefore consuming lead at the normal rate, the Home trade being particularly busy. Arrivals, on the other hand, so far this month are on the short side, the deficiency being made up by deliveries of warehouse lead. The present position of lead seems to us to be fundamentally sound, and we do not expect to see the present reaction carried very far, but look for higher prices again in the near future." The Board of Trade returns for May show:—Imports, 18,752 tons; exports, 1,005 tons, leaving for Home consumption 17,747 tons.

Irish Free State Electrical Imports.—The Irish Free State Ministry of Industry and Commerce has issued detailed figures of imports for last year as compared with 1924. From these we have compiled the appended table, showing the value of the total imports of electrical machinery and apparatus into the Free State and the amount attributed to the United Kingdom as country of shipment but not necessarily of manufacture:—

	Total.		U.K. Share.	
	1925.	1924.	1925.	1924.
	£	£	£	£
Electric wires & cables	123,620	78,416	92,367	62,619
Telegraph and telephone instruments and apparatus	28,961	28,531	27,909	28,406
Electric lamps and parts	58,917	61,913	56,878	59,221
Batteries and accumulators	36,418	32,839	34,048	29,860
Radio sets and parts ...	84,966	93,753	83,225	91,414
Other electrical goods and apparatus ...	70,703	98,535	67,355	94,412
Electric generators ...	18,042	13,313	13,822	12,265
Electric motors	23,465	17,330	22,811	16,585
Other electrical machinery	73,873	65,917	63,261	51,777
Totals ...	£518,965	£490,547	£461,676	£446,559

It will be seen that while wide variations are shown in the different classes of goods, the 1925 imports show an increase of £28,418 as compared with those of the preceding year. All but £57,289 of the goods came from the United Kingdom and of the balance £38,901 is attributed to Germany, £8,334 to Belgium. £5 to Switzerland—the last being a drop from £12,762 in 1924—and £9,049 to "other countries."

Japanese Developments.—*Commerce Reports* states that the over-development of electric power enterprises has caused a surplus of power. In consequence, business in electrical power-plant equipment is expected to slow up for about a year. In the meantime the power companies are promoting sales and encouraging the use of consuming devices for domestic and other purposes.

Trade Announcements.—MESSRS. MAXTED & KNOTT, LTD., have closed their offices at Dunstable and Queen Anne's Gate. Their new address is 82, Victoria Street, S.W.1. Telephone: Victoria 0529; telegraphic address: "Rightfully, Sowest, London."

The address of TRACTOR TRADERS, LTD., is now: Thornycroft House, Smith Square, S.W.1. Telephone: Victoria 7609; telegrams: "Tracenergy-Parl, London."

The S. H. COLLETT MANUFACTURING Co. has moved to 60, Pentonville Road, N.1. Telephone No.: North 0791.

As an impression is abroad that recent financial difficulties would necessitate the closing down of FULLER'S UNITED ELECTRIC WORKS, at Chadwell Heath, we are asked to state that the business is being carried on as usual under the control of Sir John Mann, as receiver and manager.

Owing to the expansion of their London business, MESSRS. HIGGS MOTORS have taken larger offices. Their London address is now 170, Strand, W.C.2.

Catalogues and Lists.—THE BLACKADDA RADIO Co., LTD., 48, Sadler Gate, Derby.—A booklet (price 1s.) containing details of the company's system of building various types of radio receiving sets from standard parts.

SIEMENS & ENGLISH ELECTRIC LAMP Co., LTD., 38-39, Upper Thames Street, E.C.4.—Catalogue No. 150, containing illustrations and prices of wall brackets, lanterns, electroliers, pendants, and other electric lighting fittings.

BRITISH CENTRAL ELECTRICAL Co., LTD., 6-8, Rosebery Avenue, E.C.1.—A catalogue (124 pp.) of industrial lighting fittings, conduit and fittings, cables, switchgear, instruments, &c. Fully illustrated and priced.

THE MARCONIPHONE Co., LTD., 210-212, Tottenham Court Road, W.1.—A well-illustrated price list of "Marconiphone" and "Sterling" radio receivers, accessories, and components.

MESSRS. PRIESTLEY & FORD, 3, Carr's Lane, Birmingham.—A comprehensive catalogue of radio apparatus and a pamphlet dealing with "Pye" receiving sets and components. Illustrated and priced.

BRITTAIN'S ELECTRIC MOTOR Co., 110, Cannon Street, E.C.4.—Illustrated pamphlets advertising the firm's single- and polyphase motors.

MARCONI'S WIRELESS TELEGRAPH Co., LTD., Marconi House, Strand, W.C.2.—Leaflet No. 1,056, containing an illustrated description of the Marconi recording receiver.

THE FALKIRK IRON Co., LTD., Falkirk, Scotland.—Publication No. 487, dealing with the method of cooking employing the "Falco" "inducer."

THE J. K. W. MANUFACTURING Co., 1 and 2, Bridge Street, Middlesbrough.—An illustrated pamphlet giving details and prices of "J. K. W." solid-contact lampholders.

THE IRON & NICKEL BATTERY Co., LTD., 17-19, Cockspur Street, S.W.1.—A descriptive pamphlet dealing with the company's "Ionic" nickel-iron accumulators.

MESSRS. J. H. TUCKER & Co., LTD., King's Road, Tyseley, Birmingham.—Leaflet No. 200, advertising the company's "Telac" 15-A plugs and sockets. Priced.

THE GLOBE ENGINEERING Co., LTD., Brighouse.—List No. 14, containing particulars of the company's battery-charging motor-generators and auxiliary equipment.

MR. J. R. MORRIS, Imperial House, 15-19, Kingsway, W.C.2.—A booklet containing hints on the choice of radio batteries and advertising "Columbia" products; with useful technical data.

THE VACUUM OIL Co., LTD., Caxton House, Westminster, S.W.1.—No. 24 of the "Gargoyle" Technical Series dealing with the lubrication of horizontal steam turbines for stationary plant.

MESSRS. E. P. ALLAM & Co., LTD., 107-109, Gray's Inn Road, W.C.1.—A stock list of d.c. motors, &c.

THE ENGLISH ELECTRIC Co., LTD., Queen's House, Kingsway, W.C.2.—Publication No. 768, containing an illustrated description of plate mill equipment installed at the Consett Iron Co.'s works.

MR. PAUL DIENY, 21, Laurence Pountney Lane, E.C.4.—A pamphlet advertising a crushing, mixing and separating mill for foundries.

Bankruptcy Proceedings.—J. M. LONGE, 1, Queen's Gardens, Lancaster Gate, W.—The public examination of this debtor, who formerly traded as an electric lamp manufacturer, was held on June 18th, before Mr. Registrar Francke, at the London Bankruptcy Court. He failed in April last with liabilities of £8,866 and assets "cash in hands of solicitor," £185. The debtor said that in July, 1920, he commenced and afterwards carried on business in partnership with two persons named Edgehill and Shear, as manufacturers of electric lamps under the style of "The Eclat Electric Lamp Company." He took no part in running the business, but only provided money; he paid £1,800 for a one-third share of the business and in addition advanced over £2,000 for its purposes. During 1921 he commenced proceedings for a dissolution of the partnership and in December of that year a Receiver was appointed to wind up its affairs. Witness experienced some difficulty in getting matters settled and, in fact, they were not all wound up yet. He personally discharged the liabilities of the partnership, although his partners were equally liable and he was of opinion that they owed him about £5,000. He had not returned them as book debtors, because he did not know their present whereabouts, and he was unable to recover anything. His total loss over the partnership was about £7,000. In January, 1923, witness purchased for £8,000 the Spencer Lamp Works and the Standard Lamp Works at Wimbledon, and during the next six months carried on those businesses under management. He gave bills for £2,000 on account of the purchase price, which were duly met, and the remaining £6,000 was left on mortgage. Miss Stewart, a creditor for £4,350, guaranteed advances by the bankers for the purpose of that business and also of buying a farm. In July, 1923, witness registered "The Eclat Electric Manufacturing Co., Ltd.," with a nominal capital of £500, which acquired the Wimbledon businesses and as consideration he was allotted £13,500 second mortgage debentures. First mortgage debentures were given in respect of the mortgage, and debtor was appointed one of the directors. In June, 1924, the company obtained a loan of £11,000, from the Westminster Bank, and he guaranteed the repayment of the loan. The petitioning creditor signed a guarantee to the amount of £3,500, and witness gave a guarantee for the same amount. He (debtor) also deposited with the bank, as security for the loan, shares in various trading concerns to the value of £9,000. A debenture holders' receiver was appointed on February 14th, 1925, because although the company was doing fairly well, the debenture interest had not been paid. Towards the end of 1925 the petitioning creditor called upon witness to discharge his guarantee; he could only do so to the extent of £300 and bankruptcy proceedings were instituted. The Bank sold off the securities which he had deposited, and all his other assets, including some valuable furniture, had been disposed of. In September, 1923, witness registered another company called "The Eclat Electrical Accessories (Paddington) Company, Ltd.," with a nominal capital of £1,000, to carry on business as dealers in electrical accessories. He acted as a director, but the company was not a success and he did not know anything regarding its present condition. The debtor attributed his insolvency to the failure of the two before-mentioned companies and to his liability under the guarantee for £3,500, for which he received no consideration. Apart from that guarantee he estimated his loss over the companies at £5,500. The examination was concluded.

C. J. NICHOLS, trading as C. J. Nichols & Co., 7, Park Street, Bridgend, Glam., electrical engineer.—The adjourned public examination of this debtor was held recently at the County Court, Bridgend. The deficiency was estimated at £1,308. Debtor stated that he had lost money on contracts through unforeseen events. It was stated that one of the trustees had died, and it was necessary to appoint a new one. The examination was adjourned.

E. H. TANSEY, wireless dealer, 65, Factory Road, Hinckley.—Receiving order made June 12th, on debtor's own petition. First meeting, June 25th, at the Official Receiver's offices, 1, Berridge Street, Leicester. Public examination, July 2nd, at the Castle, Leicester.

C. W. WILSON, electrical engineer, Wepre, Higher West Cross Lane, Swansea.—Receiving order made June 16th, on creditor's petition.

S. C. RAPSON, C. L. BURRILL and A. J. HEFFER (Suburban Electrical and Maintenance Co.), electricians, 2, Plough Yard, Shoreditch.—Last day for proofs for dividend, July 2nd. Trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.

J. H. PAINTER (Venables & Co.), electrician, 99, The Broadway, Cricklewood, N.W.—First and final dividend of 1s. 1d. in the £, payable at the offices of Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C.

R. C. J. WARNER and S. R. PEARCEY (Warner & Co.), electrical and radio engineers, 28, Hill Street, Poole.—Receiving order made June 10th, on debtors' own petition.

A. E. S. CHALLENER, radio engineer, 277, St. Sepulchre Gate, Doncaster.—First meeting, June 23rd, at the Official Receiver's offices, Figtree Lane, Sheffield. Public examination, July 1st, at the County Court Hall, Sheffield.

J. R. BARKER, wireless dealer, Tanshelf House, Front Street, and Gillygate, Pontefract.—Last day for proofs for dividend, June 30th. Trustee, Mr. B. S. Briggs, 21, King Street, Wakefield.

Company Liquidations.—REFLEX RADIO CO., LTD., 198, Lower Clapton Road, Clapton.—The first meetings of creditors and shareholders were held on June 14th at Carey Street, W.C. Mr. J. Barwick Thompson, Official Receiver, reported that the winding up order was made on May 11th, 1926, upon the petition of Watson & Jones, Ltd., creditors for £191. The company was formed in September, 1925, with a nominal capital of £1,000, to acquire as a going concern the business of wholesale factors of radio components, carried on under the style of Reflex Radio Company. The business had been carried on by A. T Izzard and R. E. Izzard (who were the first directors), since October, 1923. The company agreed to pay for the business £1,150, to be satisfied by the issue of a debenture for £1,000 and £150 in shares. The directors had stated that the business was carried on successfully until January, 1926, when the demand for the "Reflex" coil, of which the company had obtained the sole selling rights, considerably decreased owing to the competition of a similar coil and this resulted in the company trading at a loss On March 18th, 1925, owing to the debenture interest being in arrear, and also to the fact that creditors were pressing for payment, the debenture holders appointed Mr. F. Davies, as receiver and manager. That gentleman carried on the business until May 27th, 1926, and had realised most of the stock and book debts. He had paid off the debentures and handed to the Official Receiver a balance, with the result that, assuming the other book debts realised anything like the value placed upon them, there would be assets to the amount of £385, to meet the unsecured claims of £1,710. The failure of the company was attributed to excessive competition, heavy cost of advertising, and delay in the delivery of coil plugs at a time when there was a considerable demand. In the opinion of the Official Receiver, however, the failure was due to mismanagement and excessive expenditure. Considerable discussion ensued respecting offers sent out by the debenture holders' receiver to purchase the unsecured claims at 1s. and 3s. in the £ respectively, and eventually the chairman, in whose hands the liquidation was left, said it might be his duty to report the facts to the Court.

RADIO EQUIPMENT CO., LTD., 5, Dyer's Buildings, Holborn, E.C.—Under a compulsory winding up order made against this company last March on the petition of a creditor, Mr. G. D. Pepys, Official Receiver, reports that accounts have been lodged showing unsecured debts of £5,575; preferential claims, £37; loans on debts, £980; assets valued at £314; and a deficiency of £6,273 to the shareholders, the issued capital being two ordinary shares of £1 each. The company was formed as a private company in July, 1922, with a nominal capital of £100, to carry on business as manufacturers of and dealers in radio equipment. The promoter of the company was P. J. White, who states that he formed the company primarily for the purpose of acting as the selling agents for the manufactures of John Hall & Co., Birmingham. The directors at the date of the winding up order were the promoter and G. F. Ostins, the proprietor of John Hall & Co., who each held one of the only two shares issued by the company. In November, 1922, the company entered into an agreement with Ostins, under which it was given for a term of five years the exclusive selling agency of the "wireless accessories" output of John Hall and Company, and a considerable part of its trading has consisted in conducting this agency. The company also opened small "assembling" depôts at Stratford and Birmingham, at which receiving sets were manufactured and placed on the market as its own products. These depots, however, had to be discontinued owing to lack of capital, and in October, 1923, the directors formed Radio Works, Ltd., and to this company was transferred the goodwill, plant, stock-in-trade, &c., of the Birmingham depôt. No independent valuation of the depôt appears to have been made, and the Official Receiver states that he will require to be satisfied that the amounts apportioned were the true values and estimates or approximately so. Radio Works, Ltd., went into voluntary liquidation in February, 1926, and by its liquidator (who is also the liquidator of Radio Equipment Co., Ltd.), is claiming to be a creditor for goods supplied to the company. A debenture securing £980 was given by the company to Lighting, Heating and Glass, Ltd., but having been made within three months of the commencement of the winding-up it could not be a valid charge for more than £558, representing the value of goods supplied. The failure and insolvency of the company is attributed by White to foreign competition and insufficient capital. In the opinion of the Official Receiver, the rate of remuneration drawn by White and L. C. Russell (who acted as a director for a time) has substantially increased the financial strain and contributed to the failure of the company. On April 22nd, 1926, the debenture holder appointed Mr. C. Latham as receiver and the Official Receiver has handed to that gentleman the small amount which he has so far collected from the book debts and certain of the books. Mr. R. L. Taylor, I.A., Coventry House, South Place, E.C., has been appointed liquidator, with a committee of inspection.

SOUTHERN RADIO SUPPLIES, LTD., Junction Road, Eastbourne.—A meeting of creditors was held recently at the offices of Messrs. Edmonds, Clover & Jones, Eastbourne, when the chair was taken by Mr. P. M. Jones, who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. A statement of affairs was presented, which disclosed liabilities of £470 and assets amounting to £312, leaving a deficiency of £158. The issued share capital of the company amounted to £300, so that there was a total deficiency of £458. The position of the company was attributed to insufficient capital and losses on trading. It was decided that the voluntary liquidation of the company should be continued with the present liquidator.

ANDERSON, ANDERSON & ANDERSON.—At a special meeting on June 11th, it was decided to amalgamate the business of the company with Anderson's Bristol Rubber Co., Ltd., W. McKee and Co., Ltd., and Geo. Cording, Ltd., and with that view to wind up the company voluntarily and appoint Mr. G. Wilkins, of 52, Coleman Street, E.C., liquidator, with powers to consent to the registration of a new company under the name of Anderson's Rubber Co., Ltd.

NELSON ELECTRIC CO., LTD.—The petition of Eugene Durand and Co., of India Street, Crutched Friars, E.C., for an order for the compulsory liquidation of this company, was dismissed by Mr. Justice Romer in the Companies' Winding-Up Court on June 22nd. Counsel for petitioners said that they had been paid in full, and he asked for the petition to be dismissed.

BRITISH BARIMAR-THERMIT WELDING CO., LTD.—Winding up voluntarily. Liquidator, Mr. F. Rowland, 3, Thames House, Queen Street Place, E.C.

CAR LIGHTING & IGNITION CO., LTD.—Winding up voluntarily. Liquidator, Mr. E. R. Bradley, 584, Christchurch Road, Boscombe.

TRENT BRIDGE RADIO CO., LTD.—A meeting of creditors was held on June 22nd at 44, Parliament Street, Nottingham.

Private Arrangements.—COMTON WIRELESS MANUFACTURING CO., 26-28, Bartholomew Square, Old Street, E.C.1.—The creditors interested herein were called together on June 14th, at the above address, when the chair was taken by Mr. P. Houston, of Messrs. Corfield & Cripwell. No statement of affairs was presented but Mr. J. Mortimer, accountant, stated that the debtors had executed a deed of assignment to him for the protection of the assets that day. He had been consulted some two months earlier with a view to obtaining capital owing to creditors pressing. He read a balance sheet for the nine months ended December 31st, 1925, which showed trade creditors at £2,496, and a bank overdraft of £161. A Mr. Freeman was a cash creditor for £250 and there were sundry creditors for £232. The assets were valued at £3,907. A further balance sheet as at May 31st last showed that the trade creditors amounted to £2,508; the bank's claim was £136; Mr. Freeman was a cash creditor for £81 and there were sundry creditors amounting to £479. The assets were smaller. Several creditors held stock as security for their debts. There were three partners in the business. Two creditors had levied execution and a sale had been advertised by the sheriff for the following day. It was decided that the meeting should be adjourned for a week. The following are creditors:—

	£		£
Ebonestos Insulators, Ltd.	102	Robinson & Sons, Ltd.	52
Davis & Timmins, Ltd.	167	Barrel Polishing & Plating Works	22
Spears & Co.	88	Weber & Fluck (Switzerland)	107
Fahr & Co. (Switzerland)	340	Franklin, T. H., & Co.	171
Creasey, Geo., & Sons	23	Smith & Sons	120
Lowenadler, F. W.	540	Trader Publishing Co., Ltd.	53
Barnard & Crannis, Ltd.	40	Bankers	136
Crystalate Mfg. Co.	122	Scadding & Bodkin	53
Franklin & Freeman	405	Samuels, A. E., & Co.	249
B.D. & Co. (E. A. Boynton), Ltd.	68	Freeman, A.	81

A. & M. HAMILTON, LTD., 148, Fenchurch Street, and London Street, E.C., radio and cycle dealers.—A meeting of creditors was held on June 14th at the offices of Messrs. De Meza and Menasse, solicitors, Bishopsgate, E.C., when Mr. De Meza reported that the liabilities to trade creditors amounted to £650 and there was an amount of £725 due in respect of the rent of the two premises. The assets were valued at £700. An overdraft at the bank for £80 had been guaranteed. There were no cash creditors. The company was formed about twelve months ago with a nominal capital of £1,000, of which 400 shares had been taken up, 200 shares being given in part payment for stock. He was unable to get figures relating to the trading, but said that the present position had been brought about chiefly by the very high rents which were paid and insufficient profit. An offer was made of a composition of 5s. in the £, payable by monthly instalments and guaranteed. That offer was subsequently increased to 6s. 8d. in the £. Several creditors intimated that they would be willing to accept the offer, and it was decided that a committee of inspection should be appointed.

Dissolutions of Partnership.—HOOPEL & FARMBOROUGH, automobile and electrical engineers, 7, Loveridge Road, Brondesbury, N.W.—Messrs. F. C. Hoopel, A. E. Farmborough and W. T. Sharpe has dissolved partnership. Mr. Farmborough will attend to debts.

DASH WIRELESS SERVICE, dealers in wireless apparatus, 241, Park Road, Aston, Birmingham.—Mr. H. A. Burton and Mr. A. H. Onions have dissolved partnership.

DENNIS & JAMES, electrical engineers, Triumph House, 189, Regent Street, W.1.—Mr. R. Weaver and Mr. R. A. J. Brett have dissolved partnership. Mr. Weaver will attend to debts and continue the business under the same style.

Book Notices.—We have received a copy of the Glasgow Convention number of the *Electrical Age for Women* (6d.), the organ of the Electrical Association for Women. We cordially welcome our new contemporary and congratulate the editress, Miss Haslett, on the interesting appearance of this the first quarterly issue. Greetings received from many sources are published, also notes respecting E.A.W. activities, and a number of articles on such subjects as how electricity is made; light for the modern home; electrical refrigeration of food; electric cooking, &c.

"The Priestman-Atkinson System of Co-operative Production." (7 pp. and 4 diagrams.) London: Henry Atkinson and Co.—This pamphlet is one of a series (No. 5) in which is set forth a profit-sharing scheme involving the payment of a collective bonus on the increase of a whole workshop above a certain standard. It is claimed that this method eliminates the disadvantages of both day rates and piece rates.

"Science Abstracts" (A and B). Vol. XXIX, Part 5, May 25th, 1926. London: E. & F. N. Spon, Ltd. Price 3s. each.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIV, June, 1926, No. 354. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

"Elements of Alternating Currents and Alternating Current Apparatus," by J. L. Beaver. Pp. viii + 370; figs. 301. London: Longmans, Green & Co. Price 18s. net.

"Modern Telpherage and Ropeways," by H. Blyth. Pp. xv + 156; figs. 127. London: Ernest Benn, Ltd. Price, 27s. 6d. net.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLX, No. 6. June, 1926. New York: The Institute. Price $1.

The Summer Number of *Punch*, which has this week made its appearance (1s.) is quite up to the usual standard of excellence in respect of both humour and illustrations.

"Coal- and Ash-Handling Plant," by J. D. Troup. Pp. viii+148; illustrated. London: Chapman & Hall, Ltd. Price 13s. 6d. net.

The Timber Trade.—Our Timber Trade correspondent reports that the troubles in the coal industry have retarded the long overdue improved demand for soft timber for general and building purposes. Imports, however, were much lighter last month, and have been much lower this year compared with the early months of 1925. Consumption is fairly good, and stocks on the market, although ample, are not too large, especially in view of the much larger demand expected when trade generally resumes. Prices are steady. In the hardwood trade, imports have shown a decline; stocks, however, are still large and the demand dull, but merchants are anticipating much better inquiries from general consumers when trade is once more set going. Mahogany of the poorer qualities is obtainable at reasonable rates, as are also British and American woods. The better qualities of all descriptions, however, continue to be firm in value.

Industrial Relations.—The annual general meeting of the National Industrial Alliance, originally arranged for May 11th but postponed owing to the general strike, has been fixed for Wednesday, June 30th, at Gatti's, London. At a luncheon meeting at 1 o'clock speeches are to be delivered by the Rt. Hon. J. H. Thomas, Colonel F. Vernon Willey, Mr. Charles Sitch, M.P., and Mr. W. L. Hichens. The speeches, together with that of the chairman, Sir Edward Manville, are to be broadcast. Trade union and employer delegates from some sixty centres are to attend the meetings.

Big Turbo-Generator Contract.—MESSRS. BRITISH BROWN, BOVERI, LTD., inform us that the American Brown-Boveri Electric Corporation has just obtained an order from the United Electric Light & Power Co., New York, for a turbo-generator designed for a continuous output of 160,000 kW, to be installed in the Hellgate power station. This plant is about three times as large as the biggest turbo-generator set yet built and put into operation. We understand that the business was secured against the keenest American competition. The reason for a set of this size being ordered is to be found in the great value of floor space in and around New York. Plant of the greatest possible capacity has to be got into the space still available in this power station, amounting to 67 ft. by 39 ft. The set now on order will be of the cross compound type, *viz.*, one high-pressure cylinder at 1,800 r.p.m., and one double-ended low-pressure cylinder at 1,200 r.p.m., driving respectively generators of 75,000 kW and 85,000 kW, wound for 13,800 volts.

American Competition in Chile.—The Valparaiso correspondent of the Federation of British Industries reports that in Chile prices generally seem to be higher and steadier again, and competitive price-cutting would appear to have become less prevalent. United States prices, however, now seem lower than they have been for some time, and on a recent quotation for electrical goods, British firms were under-quoted by 10 per cent. on the actual cost of the goods, without taking into consideration commission of any kind.

The National Radio Exhibition.—The National Association of Radio Manufacturers and Traders informs us that an erroneous impression is abroad that this exhibition, which is to be held at Olympia in September, is being organised solely by that body. Such an impression could not have been gained by our readers as we made it clear in our recent note and leaderette on the subject that the Society of Radio Manufacturers was associated with the N.A.R.M.A.T. in the promotion of the show.

Social Events.—The Peterborough and District Electricity Users' Association recently gave a dinner to the volunteers and staff who maintained the supply from the Corporation's power station during the general strike.

An informal golf match was played on June 6th between golfing members of the directorates and staffs of the Automatic Telephone Mfg. Co., Ltd., and Peel-Conner Telephone Works, on the latter's course. In the singles, comprising 18 contests, the A.T.M. secured 9½ points and their opponents 8½ points. In the foursomes the Peel-Conner representatives made the best showing (4½ points to 3½); a notable victory was secured by Sir Alexander Roger and Mr. E. A. Mellinger over Sir Wm. Noble and Mr. W. Cook.

The fourth annual sports and gala of Siemens Sports Club took place on the club's sports ground, Charlton, on June 19th. The weather was excellent and the heavy programme of fifty-five events was carried through well to time without a single hitch. Callender's Prize Band played throughout the afternoon, and in addition to the actual racing, jumping, &c., there were numerous side shows and the children were not forgotten. The attendance at the sports amounted to about 5,000. Sir Walter R. Lawrence, Bt., a vice-president of the club, presented the prizes.

Coal Shortage.—It is reported that the Stanton-Holwell and Riddings works of the Stanton Ironworks Co., Ltd., are closing this week-end owing to lack of coal. About 7,000 employés are affected.

Insurance Against Bad Debts.—In a recent issue of the *Financial Times*, Sir Drummond Drummond Fraser, K.B.E., dealt with the value of credit in the commercial world, touching upon the collapse of credit caused by the war. From this he turned to the question of bad debts, and stated that before the war German banks and insurance companies performed a great work in stimulating German business at home and abroad by insuring those debt risks. Little had been done in this country, but the present time gave an exceptional opportunity to the Government to complete its work of assisting our overseas trade by encouraging private enterprise to undertake the insurance of all kinds of bad debts. Men to work such a scheme with the necessary machinery were available. But the capital required was not so easily obtainable owing to the demand being in excess of the supply. The Government should arrange for the incorporation by Royal Charter of a Credit Insurance Corporation. The capital would be subscribed by the public, and all that the Government would need to do would be to guarantee the corporation against loss. That would secure the subscription of the capital. "In my opinion there would be no risk of loss to the Government, for the premiums charged would include a percentage to reimburse the Government. The experience of the Trade Indemnity Company, in England, and of the many German companies before the war, amply demonstrates the feasibility of the idea. At the present moment the need for such an institution as I have advocated is particularly felt by those engaged in the engineering industries. They could do plenty of export business if long-term credits, insured by a first-rate corporation, were forthcoming. They would be readily forthcoming if the Government established such a scheme, as I have suggested."

Summer Holidays.—MESSRS. ALFRED GRAHAM & Co. announce that their St. Andrews and Amplion Assembly Works will be closed from Friday evening, July 23rd, until Monday morning, August 9th. The Kilmorie Works will be closed from July 30th to August 16th.

Local Exhibition.—MANCHESTER.—In our note on the recent Better Housing and Housekeeping Exhibition we omitted to mention that among the exhibitors were Messrs. Vac-Tric, Ltd., who displayed their electric suction cleaner.

Unemployment.—The Employment Exchange registers for June 7th showed a total of 1,609,100 unemployed persons, as compared with 1,614,212 on May 31st and 1,291,191 on June 8th, 1925.

Price Reductions.—THE BRITISH THOMSON-HOUSTON CO., LTD., has notified the trade of a series of substantial reductions which it has made in the list prices of its radio apparatus. Allowance is being made for existing stocks. At the same time an alteration has been made in the scale of discounts. The alterations came into effect on June 21st.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. and Messrs. James & Shakespeare report, June 22nd: No change in copper prices.

Messrs. James & Shakespeare report, June 22nd: English pig lead, £31 5s., 15s. dec.

Messrs. Edward Till & Co. report, June 22nd: India-rubber, Para fine, 1s. 8d., 1½d. inc.

For Sale.—Mr. H. J. Shaw, in conjunction with Messrs. Seymour, Seymour & Co., will sell by auction on June 29th and 30th, at 550-556, Oxford Street, W.C., wireless and X-ray apparatus, headphones, loud-speakers, accumulators, transformers, &c. Messrs. Geo. Cohen & Armstrong Disposal Corporation has for disposal the electric generating plant at the Central Power Station of H.M. Factory, Gretna. Westminster Electric Supply Corporation invites offers for two battery boosters. (See our advertisement pages to-day.)

Lighting and Power Notes.

Barugh.—DEMONSTRATION AT SUPPLY STATION.—Three men have been arrested in consequence of a demonstration recently at the Barugh electricity works of the Yorkshire Electric Power Co.

Beckenham.—NEW SUB-STATION.—The Electricity Committee has obtained a site near Lennard Street for the erection of a sub-station.

Belmont.—SUPPLY AGREEMENT.—The Town Council has decided to approve the draft agreement with the Electric Supply Co. for the supply of electricity.

Blackpool.—APPLICATION FOR SPECIAL ORDER.—The Town Council is considering applying for a Special Order to supply electricity within the urban district of Poulton-le-Fylde and the parishes of Carleton and Marton.

Bournemouth.—OIL FUEL APPARATUS.—The Corporation has authorised the provision of oil-fuel burning apparatus at the generating station in consequence of the coal dispute.

Bromley.—ELECTRICITY UNDERTAKING.—The Town Council is considering exercising its option to acquire the local electricity undertaking during the current year.

Caerphilly.—REVISED CHARGES.—The Urban Council has revised the electricity charges to 7d. per kWh for lighting, and 3½d. for power.

Colne.—YEAR'S WORKING.—The accounts for the year's working (ended March 31st last) of the Electricity Department (engineer: Mr. J. H. Thompson) show an income of £33,676, representing an increase of £754 over the previous year. The expenditure (revenue) amounted to £19,503, as compared with £18,659, leaving a gross profit of £14,173 (£14,263). The net result is recorded as £3,180 profit. The maximum demand on the undertaking for the year was 1,858 kW, an increase of 152 kW. The kWh sold amounted to 3,171,103 and the average price obtained per kWh was 2.37d. The working costs per kWh sold amounted to 1.4d.

Continental.—FRANCE.—The Société de l'Energie de Seine et Yonne, of Paris, has secured the concession for the supply of electrical energy to the rural areas of the Department of Yonne and to a number of villages in the Côte d'Or department.

La Société d'Electricité de Nantes has recently entered into a contract for the distribution of electricity to 37 small communes in the Department of Maine-et-Loire.

CZECHO-SLOVAKIA.—In order to meet the increasing demand for electrical energy, the Anglo-Bohmische Steinkohlen Gewerkschaft, of Lany, has recently installed a 3,750-kVA turbo-generator.

SPAIN.—A new small hydro-electric station has lately been completed by the Sociedad Electrica de Olloniego to utilise the water power of the River Nalon in the province of Asturias. The plant comprises two 500-h.p. Escher Wyss turbines coupled to "Asea" alternators, 50 cycles, three-phase, 6,000 V.

POLAND.—The Société d'Entreprises Electriques en Pologne continues to make steady progress. During the past year concessions were secured for the distribution of electric power in the town of Czenstochowa, for the construction of a regional power station to supply the industrial area between Nowo-Radomsk and Czenstochowa, and for the establishment of a central station at Kielce, where the work is already well in hand.

ITALY.—Among the new electricity transmission lines lately authorised by the Italian Government is an 18,000-V line which the Società Generale Pugliese di Elettricita is erecting to afford a supply of power from the Sila hydro-electric power station to a number of small villages in the province of Taranto. The Società Elettrica del Biferno has also been empowered to erect a 30,000-V line from its power station on the River Biferno to Occhito in the province of Campobasso. The Società Emiliana di Esercizi Elettrici is erecting a 15,000-V line between Mirandala and Vall Alta and between Mirandola and Secchia. A 35,000-V line and also one for 60,000 V are being erected between Polinago and Forneta in the province of Modena by the same company.

Dalkeith.—ELECTRICITY SCHEMES.—The Town Council is to submit three alternative schemes for an electricity supply in the borough.

Dartmouth.—BULK SUPPLY.—The Town Council has decided to offer no objection to the borough being included in a scheme put forward by Torquay Town Council for a bulk supply to surrounding towns, including Dartmouth.

East Grinstead.—APPLICATION FOR LOAN.—The Urban Council has applied for a loan of £5,300 for electricity purposes.

East Ham.—APPLICATION FOR LOAN.—The Electricity Committee is to seek sanction for a loan of £10,000 for the extension of distributor cables.

LOAN SANCTIONED.—The Committee has obtained sanction for a loan of £2,500 for the provision of meters.

Grange-over-Sands.—LOAN SANCTIONED.—The Urban Council has received sanction to a loan for its new electric lighting scheme.

Grays.—NEW CONVERTER.—The Council is to install an additional converter with a capacity of 750 kW.

Hamilton.—BULK SUPPLY CHARGES.—The Town Council has accepted reduced rates for the bulk supply from the Clyde Valley Electrical Power Co., based on a coal clause at 15s. to 10s. per ton.

Hull.—COAL RESTRICTIONS OFF.—The restrictions upon the use of electric power have been lifted from June 18th.

Irish Free State.—BLACKROCK (CO. DUBLIN).—The Urban Council is applying for sanction to a loan of £800 for electric lighting installation.

KINGSTOWN.—The Urban Council has reduced the price of electricity for lighting from 10d. to 8d. per kWh.

Japan. — HYDRO-ELECTRIC DEVELOPMENT. — The Korean Hydro-Electric Co. is about to commence the construction of its first generating station, which is to have an initial capacity of 50,000 kW, to be extended to 100,000 kW.

Leeds.—YEAR'S WORKING.—We have received from Mr. C. Nelson Hefford, manager of the electricity department, a copy of his annual report and revenue account for the year ended March 31st last. The total receipts for the year amounted to £563,901, as compared with £540,917 for the previous year. The working expenses amounted to £222,609, against £215,191, leaving a gross profit of £341,292 (£325,725). The net profit, after the deduction of income tax and loan charges, was £74,018, as against £79,593, out of which £32,362 was contributed to capital expenditure, leaving a surplus profit of £41,656. The capital expenditure during the year was £312,221, bringing the total expenditure up to £4,124,997. The sales for the year amounted to 100,779,954 kWh, and the average price obtained per kWh was 1.34d., as compared with 1.38d. for 1924-25. The working expenses per kWh amounted to 0.53d., as against 0.55d. in the previous year. The maximum load on the undertaking during the period under review was 48,400 kW, the figure for the previous year being 43,500 kW. The addition of a 15,000-kW turbo-alternator has brought the capacity of the station up to 82,000 kW.

Llanfair Caereinion.—INCREASED SUPPLY.—Steps are to be taken to obtain a further supply of electricity.

London.—ISLINGTON.—*Special Rates.*—The Electricity Committee has recommended that any factory solely using electricity for power and using electricity for lighting in at least 75 per cent. of the premises, both factory and offices, be charged a special lighting rate, from 7.30 p.m. to 2 p.m., of 2d. per kWh, plus 10s. per quarter meter rent.

SHOREDITCH.—*Mains Expenditure.*—The Electricity Committee has voted an expenditure of £11,000 for mains, house services and meters.

ST. PANCRAS.—*Mains Extensions.*—The Electricity Committee is to extend mains at a cost of £728.

Ludlow. — ELECTRICITY UNDERTAKING. — The Shropshire, Worcestershire and Staffordshire Electric Power Co. is to take over the electric light undertaking; the charge for electricity is not to exceed 9d. per kWh.

Manchester.—YEAR'S WORKING.—Mr. H. C. Lamb, engineer and manager of the Manchester Electricity Department, has sent us a copy of an abstract of the accounts of the undertaking for the year ended March 31st last. The income for the year amounted to £1,426,238, as compared with £1,445,495 for the previous year. The working expenses are recorded as £789,314, against £767,421, leaving a gross profit of £636,924 (£678,074). After the payment of capital charges and income tax a net profit of £32,856 is left, compared with £63,468 for 1924-25. £365,062 represents the total capital expenditure for the year, which includes £9,635 spent on machinery at the generating stations, £82,530 on the transformer and distributing stations, and £183,762 on mains. The total capital expenditure upon the undertaking now stands at £8,616,715. The number of kWh sold during the year was 300,440,765, as compared with 257,352,920 for the previous year, and the kWh unaccounted for amount to 58,989,726, or 15.24 per cent. of the quantity generated (387,008,090). The maximum demand on the undertaking during the period under review was 136,110 kW, an increase of 15,720 kW on the figure for the preceding year. The average price obtained per kWh during the year was 1.12d., a reduction of 0.21d.

N.E. Lancashire.—COAL SUPPLIES.—A number of municipal authorities in North-East Lancashire are discussing the desirability of restricting power supplies to conserve the existing stocks of fuel.

Newport.—OVERHEAD MAINS.—The Electricity Committee is to erect overhead mains, at a cost of £700, to the Llanwern Garden City Estate.

NEW SUB-STATION.—The Electricity Committee has decided to erect a sub-station at Ebbw Junction.

Northern Ireland.—AHOGHILL.—The local electricity undertaking has been destroyed by fire.

LIMAVADY.—The Urban Council has adopted a scheme for the improvement of the local electric lighting system. It is recommended that a flat rate of 6d. per kWh be charged.

LISBURN (CO. ANTRIM).—The Urban Council has approved a plan for the purchase of energy from the Belfast Corporation.

Norwich.—APPLICATION FOR LOAN.—Application is to be made for sanction to borrow £40,000 for the provision of mains and services.

Oswestry.—SPECIAL ORDER APPROVED.—Subject to certain conditions regarding rates, the Rural District Council has decided not to oppose the proposed Special Order of the Oswestry Electric Lighting and Power Co., Ltd.

Rothesay.—GENERATING STATION AND LOAN.—The Town Council has received permission to erect a generating station, for which it is applying for sanction to a loan of £14,000.

Rugby.—SUPPLY CONSENT.—The Rural Council has consented to the application of the Midland Electric Light and Power Co., Ltd., for an Order to supply electricity to parishes in the Council's area.

Russia.—KAMENEC POWER STATION.—It is announced that the construction of the Kamenec hydro-electric power station will shortly be completed. The cost is estimated at about £73,000.

Southend-on-Sea.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £10,500 for feeders and distributors.

Southmolton.—APPLICATION FOR SPECIAL ORDER.—The Rural Council has referred an application by Dr. J. A. Purves for consent for a Special Order to supply electricity in the rural area and to the parishes in the area for their opinion.

Spalding.—BULK SUPPLY.—The Urban Council has decided to use underground cables for the bulk supply from Peterborough.

Special Orders.—Applications have been made to the Electricity Commissioners for special orders by the following authorities:—The Linton Mills Estates Co., Ltd., to distribute electricity within the parishes or townships of Grassington, Threshfield and Linton, in the rural district of Skipton, in the West Riding of Yorkshire; the Shoeburyness Urban District Council, to supply electricity within the urban district of Shoeburyness, in the county of Essex; the Urban District Council of Bolsover, to supply within the urban district of Bolsover, Derby; the County Borough of Hastings, to supply within the borough of Rye, the urban district of Battle, the rural districts of Hastings, Rye, and Battle, and the parish of Ninfield in the rural district of Hailsham.

St. Helens.—NEW MAINS.—The Electricity Committee has decided to lay mains to supply the Moss Bank district at an estimated cost of £3,005.

Swansea.—LOANS.—The Electricity Committee is seeking sanction to borrow £150,000 for a scheme of electrical development, and £15,000 for public lighting mains. The Committee has obtained sanction to borrow £20,000 for mains.

Walsall.—MAINS EXTENSIONS.—The Town Council is to spend £1,500 to supply electricity to the Palfrey housing scheme.

Weymouth.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £6,000 for mains and services.

Tramway and Railway Notes.

Australia.—RAILWAY ELECTRIFICATION.—About £6,250,000 has been spent on the electrification of the railways in the Commonwealth, the result being an increase of £325,000 per annum in the revenue and an annual increase of 21,000,000 passengers.

Continental.—SWEDEN.—The electrification of the railway between Gothenburg and Stockholm has now been completed, with the exception of a little work on the Stockholm-Sodertalje section.

AUSTRIA.—The lines Salzburg-Worgl, Kufstein-Worgl, and Innsbruck-Brenner, a total of nearly 190 miles of double track and nine miles of single track, are being electrified. Energy is being supplied by the Mallnitz and Stubach electrical power stations.

Colne.—YEAR'S WORKING.—The results of the working of the tramways (engineer: Mr. J. H. Thompson) for the year ended March 31st, 1926, show a total income of £24,971, an increase of £219 on the previous year's working. The working expenses amounted to £20,999, a decrease of £745, leaving a gross profit of £3,974, or £965 in excess of the figure for the previous year. After the deduction of loan charges the net balance for the year is £4,969 loss, in addition to which £2,750 has been contributed for the earlier extinguishment of debt, making a total loss of £7,719, as compared with £6,054 for 1924-5. The car-mileage was 275,515, an increase of 161, and the working expenses per car mile amounted to 18.3d.

Glasgow.—FUEL OIL.—In order to conserve its coal stocks, the Tramways Department has adopted oil fuel for generating purposes at the Pinkston power station.

Huddersfield.—PURCHASE OF 'BUSES.—The Tramways Committee has authorised the purchase of not fewer than six new 'buses.

Japan.—RAILWAY ELECTRIFICATION.—The Choshu Railway has been granted a charter to construct an electric railway in Shimoniseki. The Komyo Electric Railway Co. is about to construct a line from Nakaizumi-machi to Kemyaji-mura. The Sendai-Shiogama section of the Miyagi Electric Railway Co. was opened on April 14th.

London.—UNDERGROUND SERVICES.—Normal services of trains were introduced on the Hampstead and City tube railways on June 21st. Improvements can be expected on the District Railway shortly.

STRIKE VOLUNTEERS.—All the men who volunteered as drivers or conductors on the L.C.C. tramways during the general strike have been retained in the service where they so desired.

TRAMCAR AFIRE.—An L.C.C. tramcar on the homeward journey to Streatham on June 15th caught fire at the Elephant and Castle. The traffic was temporarily disorganised.

Wolverhampton.—DISCARDING OF TRAMS.—The Town Council has adopted a recommendation to discard the existing tramway services, with the exception of the Bilston route, for which powers are not held, and to substitute trolley vehicles and motor-omnibuses.

Telegraph and Telephone Notes.

Australia.—"BEAM" STATIONS.—In the House of Representatives on June 14th, replying to Mr. Charlton, leader of the Labour Party, Mr. William Gerrard Gibson, Postmaster-General, stated that the delays in the completion of the "beam" wireless stations in England and Australia were due to causes beyond the control of the Amalgamated Wireless Co. The Government had received a cable from Marconi's Co. stating that the coal strike was holding up the supplies of material. In consequence, the Amalgamated Co. did not anticipate "beam" communication between England and Australia until October, or that there would be a service between Australia and Canada until about December.—*Reuter* (Melbourne).

Austria.—TELEPHONE CABLES.—The League of Nations having released £1,000,000 of the loan to Austria, for underground telephone cables, it is expected that the cable from Vienna to the German frontier at Passau will be finished by the New Year. It will then be possible to talk direct between London and Vienna, says the *Evening News*. Preparations are being made also for the laying of new submarine telephone cables between England and France and Belgium.

Iceland.—TELEGRAPH CONCESSION.—The concession of the Great Northern Telegraph Co., Ltd., in respect of the Iceland cable expires this year. Negotiations between the Danish and Icelandic Governments and the Company have, however, resulted in an agreement granting the Company a prolongation of its concession until the end of 1934, unless previously terminated by notice by either party. The agreement, which has been approved by the Parliament of Iceland, has only been secured by the company's making considerable sacrifices on various points, the total telegraph traffic exchanged with Iceland not being sufficiently large to make both cable and radio services remunerative. Under the new agreement the whole of the telegraph correspondence of Iceland, with the exception of news messages and meteorological telegrams, is retained for the cable route. In return, the company has agreed to make considerable tariff reductions, and to hand over the working of its telegraph station at Seydisfjord to the Icelandic Telegraph Administration.

Irish Free State.—LIMERICK TELEPHONE EXCHANGE.—The telephone exchange at Limerick is being transferred to the General Post Office, where it will be installed in a portion of the telegraph instrument room. A new switchboard, of American type, will be provided, which, it is said, will give more accelerated service for dealing with trunk calls.

Persian Gulf.—MARINE RADIO-TELEPHONY.—Very satisfactory results are reported from the working of the Marconi wireless telephone sets installed on harbour vessels some twelve months ago by the Basrah Port Trust. The ships so equipped in the Persian Gulf are the control vessels *Alert* and *Yenan*, the pilot vessels *Nearchus* and *Liger*, and station ship *Harmaq*, working with shore stations at Tanoomah and Fao. A wireless bell is included in each installation, which is of the Marconi YB type, so that there is no necessity for maintaining a continuous watch; any vessel or station can call any of the others with the facility of an ordinary telephone. The transmitters have a power of 100 watts, and the range for telephony, depending on local conditions, varies from 35 to 80 miles; the radius for telegraphy is from 100 to 200 miles. According to an official report, "all the stations are giving excellent results, and a considerable amount of traffic is effected." Indian signalmen man the stations, and they have rapidly gained proficiency in their work, speech generally being used.

The Telephone Service.—FOREIGN TRUNK CALLS.—Trunk telephone calls over the Anglo-Continental routes during the year ended April 30th are said to have numbered 902,571.

PHONOGRAMS FROM KIOSKS.—The latest development in popularising the telephone is the facility provided for sending a telegram by 'phone from the public kiosks. The system was inaugurated at Coventry recently. When the person has "called" the exchange in the usual way, the payment of twopence is made as if it were a local call. Then the Post Office clerk asks how many words it is proposed to include in the phonogram, and the cost is stated accordingly. All phonograms are prepaid.

Radio Notes.

Egypt.—MARCONI CO. AGREEMENT.—The Ministry of Communications has published the text of an agreement between the Marconi Co. and the Egyptian Government regarding wireless broadcasting. The agreement is for a period of 30 years, and will be renewable subsequently for periods of 10 years.—*Reuter* (Cairo).

Esthonia.—NEW STATION.—The recently-constructed broadcasting station at Tallinn is to commence operation shortly. Some 500 subscribers are said to have been registered.

Holland.—REOPENING THE HAGUE STATION.—The Commercial Secretary at The Hague (Mr. R. V. Laming, O.B.E.) informs the Department of Overseas Trade that the N.V. "Idzerda-Radio" at The Hague has again received a transmitting licence. The call sign will remain the same as that allotted to this station from 1919 to 1924, when it was closed down owing to the bankruptcy of Mr. Idzerda, namely PCGG; a wave-length of 1,150 metres will be used.

Irish Free State.—DUTY ON APPARATUS.—In Dail Eireann on June 15th, Mr. Norton moved the exemption from the 33⅓ per cent. *ad valorem* duty of component parts and accessories of wireless apparatus. Mr. E. Blyth, Minister for Finance, said it was proposed to confine the tax to completely-manufactured parts; such parts were to be exempt from duty; dismemberment would take place in such a way that the parts could be put together quickly again with very little trouble, and duty in this way avoided. Mr. J. J. Walsh, Minister for Posts and Telegraphs, saw nothing in the proposal that would increase industry. The net result would be that parts of instruments could be imported as against whole instruments, and he had not seen any considerable amount of employment given by the assembling of parts; on the other hand, the tax would create an industry there, certainly in respect of crystal sets. There were parts of valve sets which could not possibly for some time, if at all, be made there. He was satisfied that through this medium an industry would be born which would be helpful to a great many people. The amendments were lost.

New Zealand.—FOREIGN APPARATUS.—Despite New Zealand's 10 per cent. preference on British wireless goods, British manufacturers are being driven from the market, says the *Daily Mail's* Christchurch correspondent, who reports that British manufacturers are sending a crystal set which is useless in New Zealand; consequently importing firms have been forced to abandon British goods. Americans, on the other hand, are sending five-valve sets, which New Zealanders prefer, and have captured the market. In addition, the United States makers give discounts three times larger than those offered by the British firms.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Asia Minor.—BAGDAD.—June 28th. Direction Générale des Chemins de fer d'Anatolie. One electrically-driven semi-portal crane. (A.X. 3191.)*

Australia.—MELBOURNE.—June 28th. Electricity Commission of Victoria. 22,000-V transformers and spares. (B.X. 2528.)*

August 23rd. 10-in. disk suspension insulators. (B.X. 2614.)*

July 14th. Victorian Government Railways. A.c. power interlocking machine. (B.X. 2596.)*

September 1st. Automatic sub-station equipment for Elwood sub-station. (B.X. 2598.)*

August 11th. City Council. H. and l.p., 3-phase sub-station switchgear.*

August 3rd. Postmaster-General's Department. Telephones and dials.*

August 10th. Telephone exchange indicators. (B.X.2597.)*

BRISBANE.—August 26th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator.*

Belfast.—June 29th. Harbour Commissioners. Two electrically-driven main pumps, &c. Specification, &c., from the Harbour Engineer, Harbour Office, Belfast.

Belgium.—September 29th. Service de l'Armement et des Munitions, 10, Rue du Meridien, Brussels. Wireless-telegraphy sets for use on Belgian military aeroplanes. Particulars (Cahier des Charges Special No. 688) for 4 fr. from 15, Rue des Augustins, Brussels.

ANTWERP.—July 12th. Municipal Council. One single-phase converter, 1 mercury-arc rectifier, 4 static transformers for sub-station. (B.X. 2,637.)*

Brazil.—PORTO ALEGRO.—July 8th. Municipal Council. Electrical material for street lighting. (B.X. 2571.)*

Croydon.—July 5th. Electricity Department. Electric locomotive coal-handling crane and grab and electric crane track. (See this issue.)

Dublin.—June 28th. One steam turbo boiler feed pump, three air filters, two electric vehicles, and steam and water meters. (June 11th.)

Egypt.—CAIRO.—June 30th. Ministry of the Interior. One Diesel engine, direct coupled to an 80-kW generator, complete with switchboard. (B.X. 2537.)*

October 15th. Installation of electric power station equipment at Keneh and Luxor. (B.X. 2627.)*

July 10th. Director-General, State Domains Administration (Commercial Service), Savoy House, Qasr el Nil Street, Cairo. Three semi-Diesel engines and two centrifugal pumps.

August 2nd. Director-General, Mechanical Department, P.W.M., Cairo. 400-b.h.p. Diesel engine, driving an air compressor, together with auxiliary machinery.

Glasgow.—June 28th. Corporation. Electric lighting and telephone installations at the Kelvin Hall. Specifications from Office of Public Works, City Chambers, 64, Cochrane Street.

Grays.—June 30th. Grays Thurrock Urban District Council. H.p. switchgear, 3,300-V, 3-core cable, and transformers. (June 18th.)

Greetland and Stainland.—The Education Sub-Committee has decided to obtain tenders for installing electric lighting at Holywell Green school.

Huddersfield.—July 7th. Electrician's work in connection with the conversion of premises, St. George's Square and Station Street, into shops, for Huddersfield Building Society. Particulars from Messrs. Stocks, Sykes & Hickson, architects, St. Peter's Street, Huddersfield.

India.—July 2nd. India Store Department. E.h.p. armour-clad switchgear. (June 11th.)

July 16th. 500-kW rotary converters with step-down transformers. (See this issue.)

July 16th. Coal- and ash-handling plant for power station. July 30th. Steel-frame buildings and overhead electric travelling crane. August 6th. Complete boiler-house equipment or, alternatively, complete boiler-house installation, including pulverised-fuel equipment, &c. Particulars from the Department, Belvedere Road, S.E.1.

August 9th. Electrical generating plant for Peshawar power station of the North-Western Railway. (B.X. 2644.)*

Littleborough.—June 26th. Electric lighting installation, Zion United Methodist Church, Caldermoor. Tenders to Mr. R. Whipp, 10, Shore Road Littleborough.

London.—BERMONDSEY.—July 15th. Borough Council. Electrical installation for lighting, heating, and power at the baths and washhouses, Grange Road. (June 11th.)

Manchester.—July 7th. Electricity Department. Two 130,000-lb. water-tube boilers, flues, coal chutes, ash hoppers, pipework, valves, induced- and forced-draught plant and chimneys, one 40,000-kW turbo-alternator, with condensing plant, &c. (June 4th.)

Annual contract for supply to various sub-stations of 6,600-V, 3-phase switchgear. Specification from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

July 5th. 33,000-V trunk feeders, pilot cables, and telephone cables. (June 11th.)

New Zealand.—CHRISTCHURCH.—October 19th Christchurch Drainage Board. Three sets of electric centrifugal pumping plant. (A.X. 3215.)*

WELLINGTON.—August 24th. Public Works Department. Synchronous condensers for the Waikaremoana Electric Power Scheme. (B.X 2608.)*

July 20th. Phase transformer for Mangahao electric power scheme.*

August 30th. 400-V, 3-phase, slip-ring induction motors and starters.*

September 28th. Three electrically-driven low-lift pumps, with control apparatus, for the Taleri drainage. (A.X. 3274.)*

November 2nd. Electric generators and turbines for Waikaremoana electric power scheme. (B.X. 2622.)*

Normanton.—July 5th. Urban District Council. 1,400 yd. feeder cable. (June 18th.)

Electric wiring of 34 houses, Hanson House estate, and 86 houses, Snydale Road. Specification from Mr. J. Hopton, Council Offices, Normanton.

Nottingham.—July 6th. Electricity Department. Twelve months' supply of general stores. (June 18th.)

South Africa.—July 8th. South African Railways and Harbours. Telegraph material, poles, cross arms, &c. (A.X. 3173.)*

August 12th. Electric cables and wires and bare copper wire (for 12 months). (B.X. 2639.)*

JOHANNESBURG.—July 29th. Municipal Council. Transformers. (B.X. 2636.)*

Southend-on-Sea.—Electricity Department. 300 Relay switches for distant control of street lamps. (See this issue.)

Uruguay.—MONTEVIDEO.—July 6th. State Electricity Works. 1,000,000 metres of insulated conductors. (B.X. 2523.)*

July 9th. 137,500 metres of rubber-insulated wires and cables. (B.X. 2548.)*

40,000 metres of coloured twin conductor cords. (B.X. 2549.)*

July 22nd. 35,000 electric lamps.*

Whitley Bay.—July 1st. Whitley and Monkseaton Urban District Council. Wiring for electric lighting 66 houses. Specifications from Mr. A. J. Rousell, surveyor, Council Offices, Whitley Bay.

Wolverhampton.—July 10th. West Midlands Joint Electricity Authority. Two turbo-alternators, condensing plant, &c., for Birchills power station. (June 18th.)

The Transport Committee has decided to obtain tenders for vehicles, equipment, &c., in connection with the conversion of Penn Fields route to trolley-vehicle working.

July 24th. West Midlands Joint Electricity Authority. Three steam boilers, pulverised fuel plant, ash and coal handling plant and boiler house auxiliaries, for Birchills Power Station. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Beckenham.—Electricity Committee. Accepted:—
H.p. cable (£15,610).—British Insulated Cables, Ltd.
16,000 yd. .007 cable (£14,791).—Hackbridge Cable Co., Ltd.

Brighton.—Electricity Committee. Accepted:—
1,000-kW motor converter (£8,471).—Bruce Peebles & Co., Ltd.
Two complete units of steam generator plant for Southwick Works (£44,967).—Combustion Steam Generator, Ltd.

Devonport.—Royal Albert Hospital. Accepted:—
Electric lift (£600).—Smith, Major & Stevens, Ltd.

East Ham.—Electricity Committee. Recommended:—
1,450 yd. lead-covered cable (£513).—Enfield Cable Works, Ltd.

Edinburgh.—*The Times* states that on Tuesday last the Electricity Committee decided to recommend the Town Council to accept a Swiss tender for the installation of two 25,000-kW turbo-alternators at a cost of £138,000. The lowest British offer was £52,000 more.

Faversham.—Town Council. Accepted:—
Installation of electric fire bells at the residences of the members of the fire brigade.—Jabez Smith & Son.

Government Contracts.—The following Government contracts were placed during May, 1926:—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

Aluminium alloy electrical fittings.—General Electric Co., Ltd.; W. McGeoch & Co., Ltd.; Engineering & Lighting Equipment Co., Ltd.
C.T.S. electric cable.—Anchor Cable Co., Ltd.; General Electric Co., Ltd.
Underground cables and switchgear.—Johnson & Phillips, Ltd.
Conduits and accessories.—Eureka Conduits & Fittings Co.; Electric Conduits, Ltd.; Barton & Sons, Ltd.; General Electric Co., Ltd.; Talbot Stead Tube Co., Ltd.
Electric light installation.—G. E. Taylor & Co.
Lifts.—Smith, Major & Stevens, Ltd.
Motor.—Laurence Scott & Co., Ltd.
Motor alternators.—Small Electric Motors, Ltd.
Motor generators.—Small Electric Motors, Ltd.
Switchboards.—Park Royal Engineering Co., Ltd.
W/t attachments.—Radio Instruments, Ltd.

CROWN AGENTS FOR THE COLONIES.

Insulated cables.—St. Helens Cable & Rubber Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.
Cable and wiring material.—Siemens Bros. & Co., Ltd.
Cableway aerial.—J. M. Henderson & Co., Ltd.
Electrical equipment.—J. Stone & Co., Ltd.
Overhead line material.—Bullers, Ltd.
Static transformers and spares.—Ferranti, Ltd.
Telephone switchboards.—British L.M. Ericsson Mfg. Co., Ltd.
Electric truck.—Ransomes, Sims & Jefferies, Ltd.
Copper wire.—Shropshire Iron Co., Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.

Hemsworth.—Rural Council. Accepted:—
Wiring 50 houses at Great Houghton, at 25s. per point, including the provision of plain shades and globes.—Houghton Main Colliery Co., Ltd.

London.—ISLINGTON.—Electricity Committee.
10,000-kW turbo-alternator (£51,320).—Metropolitan-Vickers Electrical Co., Ltd. (Accepted.)
Installation of interlinking mains with Hackney and St. Pancras.—British Insulated Cables, Ltd. (Recommended.)

HACKNEY.—Works Committee.
One 40-cell I.M.V.8 "Exide-Ironclad" accumulator, less allowance for the old battery (£158).—Chloride Electrical Storage Co., Ltd. (Recommended.)

Southend-on-Sea.—The Town Council has renewed for another year the existing contract with Callender's Cable and Construction Co., Ltd., for cables based upon the daily market price of copper and lead as disclosed by Bagot's list.

Wirral.—Board of Guardians. Accepted:—
Installing electric lighting, heating, &c., at the extensions to the Institution at Clatterbridge (£12,322).—Ashwell & Nesbit, Ltd.

Forthcoming Events.

Second British Electro-Farming Conference.—Thursday, July 8th. At the Royal Agricultural Society Show Ground, Reading. At 12 noon.

Notes.

Electric Arc-Welding a Bridge.—The Worcestershire County Council has now decided, after investigation, to strengthen Holt Fleet bridge (over the River Severn) by the method of electric-arc welding as applied to the bridges on the Paris, Lyons and Mediterranean Railway. The cost of the welding is estimated at about £4,000 and the masonry abutments at a further £4,300.

Inventions Commission.—The Inventions Commission, sitting at the Law Courts in London on June 14th, under the chairmanship of Mr. Justice Tomlin, heard the claim of Prof. Miles Walker in respect of supersonic signalling. Prof. Walker claimed for an exceedingly small fraction of the effort that was made by a large number of experimenters to solve a very difficult and important problem—how to detect and locate a silent submarine. He did not claim that his work on the solution of that problem was as great as that by many other experimenters in that field, but he was the first to suggest to the Admiralty a very promising line of attack on submarines. His first experiments in submarine echoes were made in 1899 after the sinking of the *Stella*, when he was a student at Cambridge. He thought it was possible for a ship to get warning of hidden rocks by means of a submarine echo. In 1912, when he was appointed to Manchester, a student under his direction made experiments for the detection of high-frequency sounds. In 1913 he was sold a patent which had been evolved for the detection of icebergs. After the war broke out he explained his device to the Admiralty, and experiments were carried out with a water siren for the detection of submarines, but his suggestion was not adopted. Another method, however, was found to be more satisfactory. The Commission reserved its decision.

Flood Interruption of Supply.—The energies of some 30 men employed for the past three weeks by Captain J. A. Ritter in endeavouring to repair a breach in the "lead" which supplied the water power to the power station at Limavady have again been nullified through the recent abnormal rainfall, causing a heavy flood in the River Roe. A large tree, brought down by the flood, broke the sluice gates in the river, and caused the torrent to rush into the "lead," breaking the river bank. Captain Ritter has been able to supply light to the town for a few hours each evening, generated from a dynamo in the Rectory grounds. It will be some time before current can be generated at the station, so inconveniently interrupted.

Development of French Electrical Works.—M. de Monzie, the French Minister of Public Works, referred at length to the question of the development of the national electrical equipment at the recent annual dinner of the Union des Syndicats d'Electricité. Reference was made to the law passed recently by the Chamber, intended to impose a tax of 5 per cent. on consumers of energy so as to provide funds for the provision of electrical works. It is stated that the Professional Syndicate of Producers and Distributors of electrical energy, which mainly represents the steam power stations, is particularly interested in the matter, and has unanimously expressed its agreement with the scheme in principle, and that the Chambre Syndicale des Forces Hydrauliques is equally favourable. The Union des Syndicats d'Electricité, which combines all the electrical syndicates, will examine the problem at its meeting in July.

Chromium Plating.—The electro-deposition of chromium is exciting considerable interest owing to its anti-corrosive property when deposited upon non-ferrous metals being strongly marked. Articles of brass, nickel silver, copper, &c., when plated with chromium, appear to withstand climatic conditions and exposure indefinitely. In the case of non-ferrous metals, the deposit is unique; it is virtually glass hard, and is capable of receiving a brilliant polish which will withstand rough handling without becoming scratched or the polish in any way diminished. The colour is of a silvery whiteness tinged with blue, and its great hardness is allied with heat resisting properties. The deposition of the metal is slightly more difficult than the deposition of nickel, but the plant required is only a slight departure from the standard equipment. Messrs. W. Canning & Co., Ltd., have furnished us with a sample article finished in chromium, and have, we understand, installed several plants for the deposition of the metal, which have been a proved success.

Association of "Old Cromptonians."—The members of this Association held their second annual dinner on Friday, June 18th, at the Royal Automobile Club. Originally the meeting was fixed for the nearest Friday to Col. Crompton's birthday, but the strike caused a postponement, while the new date found very many members at the Glasgow Convention, and this reduced the attendance, which otherwise would have reflected the desire of all to welcome the grand old president on his return from the United States. We learn that the "Guv'nor" was in excellent form in giving a brief account of his American impressions. These may be crystallised with the observation that you can say to an American anything except that "It's a young country and has room for improvement." The general meeting re-elected Mr. C. S. Peel as hon. secretary and Mr. M. Whitgift as hon. treasurer and assistant secretary, and a committee consisting of Messrs. E. J. Fox, H. D. Harris, Lt.-Col. H. M. Leaf, D.S.O., J. W. Meares, C.I.E., A. E. Mohring, E. Reeves, A L. Stevens, and J. Swinburne, F.R.S.

Royal Air Force Display.—The seventh Royal Air Force display will take place at the Royal Air Force aerodrome, Hendon, on July 3rd. The object is to demonstrate the progress in the work, training, and equipment of the Royal Air Force, and as participation in the display is largely competitive it affords a valuable stimulus to training. The proceeds are given to the Royal Air Force Memorial Fund, which has already benefited to the extent of more than £34,000 since the display was established six years ago. An event which will have a popular appeal will be squadron drill carried out by wireless telephony, orders being given by the squadron leader from his machine in the air, or from the wireless ground station. The use of wireless telephony, although still somewhat in the experimental stage, has already shown that it greatly facilitates squadron operations; it enables the leader to pass his instructions with certainty, and it enables the pilots to understand clearly what air manœuvres they are to carry out. Arrangements are being made to develop the use of "public address" equipment by the incorporation of 20 or more Marconiphone loud speakers erected on pylons in the different enclosures, each pylon being connected with the control room in the hotel by means of underground cables.. Precautions are being taken this year to guard against the interference experienced while receiving from aeroplanes last year. Four receiving stations will be used, each one receiving independently of the other. All will be connected by land lines with the control room, but it is expected that the main reception will take place at a point within five miles of the Hendon aerodrome. This reception point will be coupled by Post Office land line to the control room. It has been found that the best reception is obtained when aeroplanes are some distance from the receiving point.

The Magnetic Elements at Greenwich.—The report of the Astronomer-Royal for the past year states that in 1925 the declination W. was 13 deg. 10 minutes; the horizontal force was 0.18413, and the vertical force 0.43081, c.g.s. units; the dip was 66 deg. 51.5 mins. Magnetic observations at Greenwich will shortly be discontinued, the work being transferred to Abinger, on account of the electrification of the railways near the Royal Observatory.

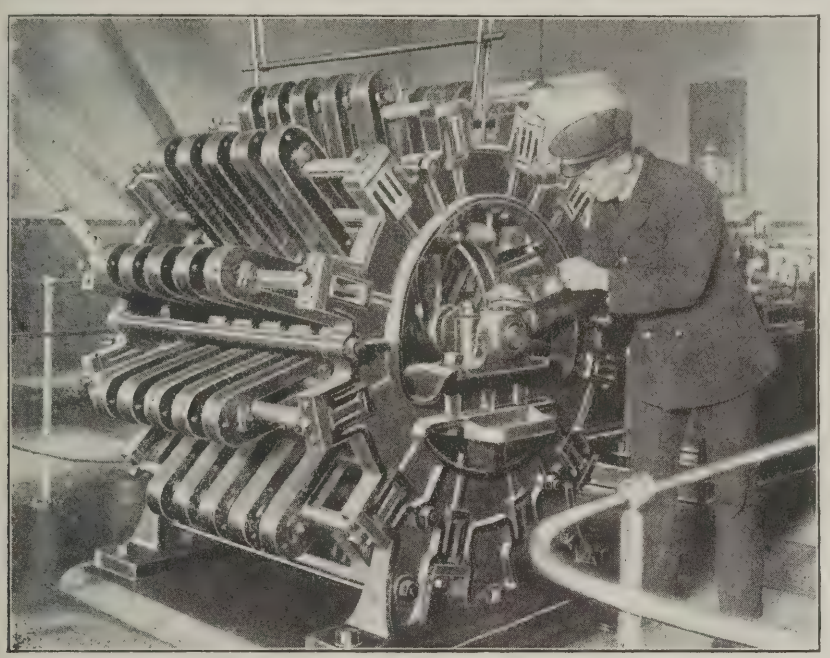
The wireless time signals received from the Continent are slightly late on Greenwich, the Eiffel Tower lagging 0.11 sec. and Nauen 0.05 sec.

The Shortt free-pendulum clock is working well, and a second clock of this type is being installed; the rate of the first one is increasing by 0.011 sec. per day, per month.

Water Power in Newfoundland.—In a recent report (Stationery Office, 2s. 3d. net) upon conditions in Newfoundland, Mr. F. W. Field, Senior Trade Commissioner in Canada and Newfoundland, says that there is considerable water power in the Colony, but recent estimates are not available. Little has been done to develop them, with the exception of the work of two paper companies. The Anglo-Newfoundland Pulp and Paper Company has utilised power both at Grand Falls and Bishop's Falls. About 23,000 h.p. has been developed out of an available 30,000 to 35,000 h.p. The water is conveyed from the forebay to the power house, a distance of about 2,000 ft., by means of two steel pen-stocks 15 ft. in diameter. The net maximum head is 110 ft. The maximum head to which it was possible to develop the power at Bishop's Falls was 36 feet. Eight sets of 1,700 h.p. each were provided, and seven of these were fully developed, six of them being directly connected to three pulpwood grinders each, and one driving a 500-kW generator and, by means of rope drives, various pieces of machinery throughout the plant. The remaining set will eventually be used for the generation of more electrical power when required. The power required by the Newfoundland Power and Paper Company, which established its pulp and paper mills at Cornerbrook, is obtained from Deer Lake, 32 miles away. Construction of the hydro-electric plant and of the paper mills by the general contractors was commenced in June, 1923. Paper was produced in July, 1925, very little over two years after the inception of construction. The power plant at Deer Lake has a capacity of 100,000 h.p., which is transmitted to the mills over four transmission lines. The average head on the turbines is from 250 to 265 ft. The flow of water for the power development is obtained from Grand Lake, which has an area of 215 sq. miles and a drainage area of 1,650 sq. miles. From this an average yearly flow of 5,000 cu. ft. per second is available. Owing to the large seasonal variations in the flow of water from this area, Grand Lake is being used as a regulating storage reservoir with a capacity of about thirty thousand million cubic feet. To control this reservoir, a hollow reinforced concrete dam, 800 ft. long and 75 ft. high, was constructed. The dam has a spillway with a capacity of 26,000 cu. ft. per sec. for the purpose of discharging the occasional heavy floods which occur. This consists of eighteen 15-ft. wide electrically-operated sluiceways. Owing to the increased height of Grand Lake, which is raised some 30 ft. by this dam, a diversion of the railway was necessary, and it is carried over Junction Brook on the dam. To convey the water from Grand Lake to Deer Lake power house, a canal seven miles long was built. Formerly pulp and paper mills were always erected at or very near the hydraulic power. To-day many of them are located to suit other conditions—housing of operatives, pulpwood supply, shipping, etc., the hydraulic power being converted into electrical power and transmitted to the pulp and paper mills.

Electricity v. Gas at Weymouth.—The Estates and Housing Committee of the Weymouth Council recently made a recommendation that the local Gas Company should not be allowed to install gas cookers in certain of the Council's houses. A great deal of discussion occurred when the matter came before the Council. The Committee's view was that the municipal electricity undertaking should be given preference over the Gas Company in municipal houses, but a number of members objected to such a "monopoly" and thought that the tenants should be free to choose electricity or gas. A councillor stated that before the houses were erected the Gas Company was asked if it would install gas cookers, but it refused to do that unless it was also permitted to fit gas coppers, geysers and lighting. The chairman of the Electricity Committee said that they could install electric cookers at as low a cost as the Gas Company could do gas cookers. It was decided to refer the recommendation back to the Committee with a proposal that consent to install gas cookers only should be given to the Gas Company.

The Shannon Scheme.—Recent developments in connection with the work on the Shannon hydro-electric scheme at Ardnacrusha, Co. Limerick, include the erection of a fire station, with hydrants at danger points, three miles of hose being provided; and the erection of a school for about 35 or 40 German children, whose fathers are engaged on the scheme.



Fatality. — George Chrich (13), of Rossington, was killed recently when climbing an 11,000-V transmission standard of the Yorkshire Electric Power Company, after a bird's nest. The boy apparently touched the transmission wire and received a fatal shock, his legs being severed at the knees and the fingers on one hand burnt off. He appeared to live for a few minutes before falling dead to the ground. At the inquest a verdict of "Accidental death" was recorded.

Gold from Mercury.—The claims by Drs. Miethe and Hantaro Nagaoka to have produced gold from a base metal, mercury, have for some time been subjected to sceptical criticism in the scientific world, and the subject was discussed at a recent meeting of the German Chemical Society in Berlin. It was suggested by one professor that the presence of gold even at a distance, as in the operator's spectacle frames, or in metal compounds in an adjoining room, might spoil the experiment through its being drawn in ultramicroscopic quantities into the electric current, by an effect like that of the cathode rays. Other criticism pointed to the suggestion that there were always traces of gold in mercury which would vitiate the results of the experiment. Prof. Miethe said that in 42 experiments the output of gold was constantly proportional to the current and the time of the process. The claims of Prof. Miethe are supported by those of Dr. A. Gaschler to have produced mercury from gold. The process consisted, according to *Science*, of sealing a gold electrode in a vacuum tube and bombarding it with a stream of positive hydrogen atoms shot through the tube at a high velocity. After 30 hours' bombardment the spectrum lines from the gold indicated the presence of mercury, which became stronger as time elapsed.

Village Water Power.—At the annual meeting of Messrs. James Finlay & Co., Ltd., Glasgow, Mr. W. Brown, who presided, said that at Deanston, where most of their employés lived on property owned by the company, they were arranging for the erection of more houses, which they hoped would enable all their looms there to be run. They had water available for power purposes and intended to light not only the new houses but the whole village electrically.

Exhibition of Inventions.—The second International Exhibition of Inventions, organised and managed by the Institute of Patentees (Inc.), is to be held at the Central Hall, Westminster, from October 13th to 26th next. The exhibits will be arranged in two sections, A for inventions on the market, open to any potential exhibitor, and B for inventions on the market, open to members of the Institute of Patentees. Applications for space in both sections are invited. Full particulars may be obtained on application to the Institute, 39, Victoria Street, Westminster, S.W.1.

Lighthouse Electrical Equipment.—We reproduce herewith a photograph of the electrical generator installed at the Lizard Lighthouse, Cornwall, for supplying the signalling apparatus. It is a De Meritens alternating current magneto-electric machine of French make. The field system consists of five sets of twelve permanent magnets, sixty in all, each magnet being made up of eight steel plates. The armature is 2 ft. 6 in. in diameter, and is composed of five rings with twenty-four bobbins in each ring arranged in six groups of four bobbins each. The machine develops, with the arc lamp in the circuit, a current of about 150 A at 30 V. The slip-rings and the brushes are arranged so that 2/5ths, 3/5ths, or the whole of the current can be used. The machine runs at 600 r.p.m., giving a periodicity of 120 cycles. The machine was installed at the Lizard in 1893, having been previously used for experimental work at South Foreland Lighthouse. A smaller machine of the same type, which runs at 910 r.p.m., is also used as a stand-by. A pair of similar machines have run the light at St. Catherine's Lighthouse, Isle of Wight, since 1887.

Permanent-Magnet Alternator at the Lizard Lighthouse.

New Uses for Beryl.—The Canadian Department of Mines reports a great increase in the demand for beryl, a mineral whose new uses include substitution for feldspar in the manufacture of sparking-plug and insulator porcelain.

Power Line Communication.—What is claimed to be the first repeater for high-frequency telephone communication over power transmission lines has recently been installed by the Westinghouse Electric & Manufacturing Co. in America, as a result of which Indianapolis is now connected to Terre Haute by means of a 132-kV line and to Kokomo by means of a 66-kV line (both generating stations, while that at Indianapolis is a transformer sub-station). The lines from Terre Haute and Kokomo terminate in their respective transformer banks, the two systems being electrically isolated in so far as the high-pressure lines are concerned. High-frequency wireless telephone equipment had previously been installed at all three points, and the system load dispatcher is located at Indianapolis, where the repeater installation is also located. The two-frequency duplex system employs one frequency for transmission and a different frequency for reception, which function entirely independently, and both may proceed simultaneously. Mr. C. A. Boddie, of the Westinghouse Co., states that simultaneous transmission and reception is an absolute necessity, and the repeater must perform both operations at the same instant. The achievement of repeater action at Indianapolis required no additional apparatus nor alteration in the normal mode of operation—only the insertion of a suitable transformer between the output circuit of the high-frequency receiver and the speech-input circuit of the transmitter, thus coupling the circuits together. An incoming signal or talk from either direction is thus applied directly to the transmitter, which is accordingly modulated just as though the distant speaker were at Indianapolis instead of at one end of the line. The transmitter, therefore, faithfully repeats what comes into it, to the station which it is desired to reach, and also feeds back to the station where the signal originated; when the operator at Terre Haute is talking to Kokomo all three stations are in action, each transmitter delivering its normal high-frequency output to the line.

The "tie-back" between the receiver and transmitter which converts the Indianapolis equipment into a repeater not only enables it to function as a repeater, but also permits three-party conversation between the load dispatcher at Indianapolis and the Terre Haute and Kokomo operators. It is claimed that the ease and simplicity with which a standard two-frequency duplex system can be made to function as a repeater permits extremely long lines to be operated, and dissimilar systems which are electrically isolated, tied together in a communication system. It offers a valuable means of getting past a break in a line, for if a line is sectionalised at a point where a telephone set is installed, such a set can be converted into a repeater, and the break by-passed without loss in signal strength or resort to special coupling devices.

The Position of the Combustion Engineer.—Referring to recent correspondence in the technical Press on this subject—obviously that which appeared in our pages some time ago—and an article by "a well-known combustion expert," evidently that of Mr. Charles F. Wade, published in our issue of December 25th, 1925, p. 1014, Mr. E. B. Pausey discussed this question in the April issue of *The Electrical Power Engineer*, pointing out that the term "Combustion engineer" needs definition, and that the Schedule of Salaries and Conditions should be expanded to define the duties and responsibilities of the engineers employed in power stations. He puts forward the following suggestion for a standardised technical staff for a power station of about 10,000-kW installed capacity: "Assistant Shift Engineer, to attend to the switchboard and look after the turbine room in the shift charge engineer's absence, Grade 9 or 8b; Testing and General Assistant to Boiler-House Superintendent, to test coal and water, attend to recording and other instruments and assist in the work of the boiler house as required, Grade 8a; Shift Charge Engineer, who, being provided with an assistant to relieve him of much of the turbine-room routine work, should devote most of his attention to the operation of the boiler house, Grade 8; Boiler House Superintendent, complete charge of boiler operation, repairs and maintenance of boilers and plant connected therewith, Grade 6; Power-Station Superintendent, generally responsible for the operation, repairs and maintenance, and organisation of the whole of the power-station plant, Grade 3. A scheme like this would have several advantages over the haphazard arrangements in vogue at the present time. It would provide a logical ladder of promotion, at each step of which the engineer would be able to fit himself for the next step; it would define the duties and fix the minimum salaries for the different steps; and it would ensure a well-organised staff, which need contain no elements of discord, and would be capable of working together as a unit and manifesting a team spirit. It will be noted that there is no excrescence of the nature of an independent 'combustion engineer' to introduce discord into what should be a harmonious whole; on the other hand, at each step of increasing responsibility, the engineer would continue to be responsible to his superior until finally the Power Station Superintendent would be responsible to the Chief Official, either directly or through the Deputy Chief where such an official exists. At the same time, with the exception of the member in the lowest grade, all the officials will be combustion engineers, for their duties consist, at least to a very important extent, of the supervision of combustion or processes subservient thereto. I think the staff I have now described would be typical of efficiently organised power stations of that capacity and somewhat larger; in still larger plants, of course, the personnel of the technical staff would correspondingly increase by the addition of various assistants."

Lecture.—"Is Scientific Invention becoming a Nuisance?" is the subject of the lecture at the London School of Economics on July 6th at 5-30 p.m. in aid of the King Edward's Hospital Fund. Prof. A. M. Low is one of the speakers.

Appointments Vacant.—Telephone engineer (£800) for the United River Plate Telephone Co., Ltd. Electrical engineers (£250+) for the Tropics. (See our advertisement pages to-day.)

Direct Electric Iron Production.—At a meeting of shareholders of the Uddeholm Company at Stockholm it was stated that trials had been made during the past few months at the Hagfors ironworks of the method of direct electric iron production invented by the chief engineer, M. Flodin. The trials proved the possibility of producing forgeable iron in this way, but nothing is yet known definitely of the economic aspects of the process. The Uddeholm company has not yet acquired the method, but has reserved priority of the right to do so if it proves economically profitable.—*Reuter's Trade Service* (Stockholm).

Institute of Transport.—ANNUAL CONGRESS.—The Council of the Institute, after considering certain alternative venues to Birmingham, has reluctantly been constrained to abandon the idea of holding a congress this year. The annual dinner of the Institute, originally fixed for April 21st last, will take place at the Hotel Cecil, London, on November 18th.

EXAMINATIONS.—The next examinations will be held in the last week in April, 1927. Centres tentatively decided upon are: London, Birmingham, Bristol, Leeds, and Manchester. Arrangements will be made for holding examinations in South Africa, India, Australia, New Zealand and South America, or other centres overseas from which a satisfactory number of candidates may be forthcoming.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

The Monmouth Town Council has decided to increase the salary of the electrical engineer by 10s. weekly and to grant him a coal allowance up to 10 tons annually.

The *Daily News* states that Mr. JAMES W. MCKAY, Birdhurst Rise, South Croydon, has been appointed general secretary of the Electrical Wholesalers' Federation, Ltd.

Sir ERNEST RUTHERFORD has been elected a member of the Academy of Sciences of Cracow.

It is announced in the Press that Mr. ARTHUR HYLAND, the Special Commissioner of the Australian Government and Director of Trade and Publicity, has arrived in London.

Mr. HARRY HALL, of Nelson, has accepted an important post with Messrs. Parkinson (Australia), Ltd., of Sydney, and is sailing on July 2nd from Tilbury. Messrs. Parkinson are associated with Messrs. F. & A. Parkinson, Ltd., of Guiseley, Leeds, for whom Mr. Hall has been the Manchester manager for two years.

The Faversham Town Council has increased the salary of the electrical engineer, Mr. G. SOMERVILLE, from £416 to £500 per annum.

The Marconiphone Co., Ltd., announces that Mr. F. W. PERKS, who until recently was its London manager, has been appointed general sales manager. The duties of London manager will be taken over by Mr. E. A. OAKMAN.

Mr. HAMLYN DRAKE, B.A., who served in the Horse Artillery in Palestine, and acted as A.D.C. to General King, has been elected a director of Messrs. Drake & Gorham, Ltd. Mr. Hamlyn Drake, who is the only surviving son of Mr. Bernard Drake went through the B.T.-H. works at Rugby, and made a study of electric furnaces in America.

Upon the thirtieth anniversary of the granting of the first Marconi wireless patent, Senatore MARCONI was honoured by his native town, Bologna, Italy. Among other things, a number of annual prizes and gold medals were instituted for award to students.

It is announced that Sir ALEXANDER B. W. KENNEDY having, owing to advancing years, resigned his position as director and engineer-in-chief of the Westminster Electric Supply Corporation, Ltd., the board has appointed the general manager, Mr. W. A. PEARMAN, to fill the vacant seat on the board. Mr. P. L. RIVIERE, who is resigning the position of electrical engineer in the L.C.C. Tramways Department, has been appointed engineer-in-chief of the company. Sir Alexander Kennedy was born in March, 1847.

Mr. G. S. W. MARLOW, B.Sc., F.I.C., has been released by the Association of British Chemical Manufacturers to devote part of his time to the appointment of secretary and editor to the Faraday Society and secretary of the Institute of Physics, pending the completion of final arrangements for carrying on the official work of these bodies. Mr. Marlow was assistant secretary to the Institute of Chemistry from 1919-1925.

Mr. W. J. E. BINNIE (Sir Alexander Binnie, Son & Deacon) has been elected chairman of the committee of the Association of Consulting Engineers for the year 1926-1927.

Mr. F. W. FIFIELD has resigned his position as manager of the Bristol depôt of the Edison Swan Electric Co., Ltd.

Brighton Lighting Committee recommends that Mr. J. CHRISTIE, chief engineer and manager, be authorised to visit the United States to study electricity developments, particularly in relation to the new machinery, and that he be granted for the purpose an allowance of £400.

Mr. W. A. BENGER has taken up the agency for Yorkshire for the Electrical Apparatus Co., Ltd., London.

Obituary.—MR. A. V. DOWNTON.—The death took place at Southbourne, Bournemouth, on June 14th, of Mr. Albert Victor Downton, of Lesney View, Lesney Park, Erith, who was up to the time of his death general manager and technical adviser of the Enfield Cable Works. He was 53 years of age, and commenced his career at Callender's works at Belvedere, where for some years he was manager of the cable department. Before becoming associated with the Enfield Cable Works he was for some time with the Pirelli cable works at Southampton.

LADY NOBLE.—We desire to tender our condolences to Sir William Noble, formerly engineer-in-chief to the G.P.O., and now a director of the British Broadcasting Co. and of the General Electric Co., Ltd., on the death of Lady Noble, which occurred at Leamington on June 21st, at the age of 61 years.

MR. J. CORSON.—Mr. John Corson, of the Shanghai Municipal Electricity Department, Shanghai, has died in the General Hospital there at the age of 26 years. Mr. Corson, who began his career in the Kilmarnock Corporation Electricity Supply Department, was engaged by the Shanghai department in 1922 as meter assistant.

Will.—The late Sir T. A. COGHLAN, Agent-General in London for New South Wales and a director of the West India and Panama Telegraph Co., Ltd., left property of the value of £1,420 in England, with net personalty £239.

New Companies Registered.

C. H. Rees & Co., Ltd. (214,363).—Private company. Registered June 14th. Capital, £3,000 in £1 shares (2,500 preference and 500 ordinary). Objects: To adopt an agreement with L. Jacobs (London), Ltd., and to carry on the business of agents for, or merchants of electrical supplies and glassware, referred to therein. The life directors are:—W. Rose, Stonington, Station Road, Hendon, N.W.4, manufacturer (chairman); C. H. Rees, 3, Mayfair Road, West Jesmond, Newcastle-on-Tyne, merchant; F. P. Onate, 70, Wandsworth Bridge Road, Fulham, S.W., merchant. Qualification, £100. Remuneration as fixed by the company. Secretary: W. J. Braine. Solicitor: F. H. Stollard, 73, Basinghall Street, E.C.2. Registered office: 6, Dyers Buildings, Holborn, E.C.1.

Bel Canto Radio Reproducer Co., Ltd. (214,392).—Private company. Registered June 16th. Capital, £100 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in loud speakers, gramophones and sound producing or reproducing or recording instruments of all kinds, &c. The first directors are:—Charles Mahe de Chenal de la Bourdonnais, Prince de Mahe (permanent governing director), Loventor Manor, near Totnes, Devon; John B. D. Mahe de Chenal de la Bourdonnais, Prince John de Mahe, Loventor Manor, near Totnes, Devon. Solicitors: Johnson, Weatherall, Sturt and Hardy, 7, King's Bench Walk, Temple, E.C.4. Registered office: 68, Farringdon Street, E.C.

Cablon, Ltd. (214,394).—Private company. Registered June 16th. Capital, £2,000 in £1 shares. Objects: To buy, manufacture, import, export and deal in and generally to exploit and promote the manufacture and use of super-high-tension cables, high and low tension cables and cables of all kinds, wires, switches, fuses and all other accessories, machinery, plant, apparatus, and materials of all kinds used in connection with electricity or in the electrical or other kindred trades, &c. The subscribers (each with one share) are:—F. E. Smith, 4, Langford Place, N.W.8, solicitor; H. E. Callow, 1, Edward Avenue, Morden, managing clerk. The first directors are to be appointed by the subscribers. Qualification, £1. Remuneration as fixed by the company. Solicitors: Freshfields, Leese and Munns, 31, Old Jewry, E.C.2. Registered office: Lincoln House, 296-302, High Holborn, W.C.1.

Crosland, Ltd. (214,364).—Private company. Registered June 14th. Capital, £2,000 in £1 shares. Objects: To carry on the business of wholesale dealers in electrical, mechanical and motor goods, motor, mechanical, electrical and general engineers, machinists, smiths, cleaners, fitters, &c. The first directors are:—M. A. E. Crosland, 13, Furlwell Lane, Batley, electrical engineer; W. Burnley, 1, Camden Terrace, West Park Street, Dewsbury, accountant. Qualification, £1. Secretary: W. Burnley. Solicitor: R. W. Stapleton, 24, Union Street, Dewsbury. Registered office: Russell Street, Batley, Yorks.

Cornwall Power Co., Ltd. (214,395).—Registered as a "public" company, on June 16th, with a nominal capital of £210,000 in £1 shares. The objects are to carry on in England or elsewhere the business of an electric light and power company in all its branches, and to adopt an agreement with the Urban Electric Supply Co., Ltd., for the sale to this company of all shares held by the "Urban" Company in the Cornwall Electric Power Co. Minimum cash subscription, 7 shares. The directors are:—P. D. Tuckett, 17, Durham Villas, Kensington, W.8, barrister; H. T. Crosthwaite, Little Bowden, Pangbourne, stockbroker; H. B. Grotrian, Knolls, Leighton Buzzard, barrister; E. Charrington, Ice Wood Cottage, Limpsfield, electrical engineer; F. E. Gripper, 14, Malbrook Road, Putney, electrical engineer. Qualification, £1 or such other amount as may be fixed by the company. Remuneration as fixed by the company. Secretary: C. H. Jones, 67, Hayes Road, Bromley. Solicitors: Linklaters & Paines, 2, Bond Court, Walbrook, E.C.4. The registered office is at Broad Sanctuary Chambers, Westminster, S.W.1.

Ceag, Ltd. (214,442).—Private company. Registered June 18th. Capital, £1,000 in £1 shares. Objects: To acquire the business carried on by the "Ceag" Miners' Supply Co., Ltd., Barnsley, also to acquire the registered trade mark "Ceag," No. 346,135, and to carry on the business of manufacturers, importers and exporters of, and dealers in electrical and other safety lamps for use in mines, &c. The first directors are:—E. R. J. Plummer, Wellfield House, Barnsley; W. Plummer, "The Elms," Ashford, Middlesex. Qualification, one share. Remuneration as fixed by the company. Secretary: J. Lees. Solicitor: A. P. Williamson, 19, The Square, East Retford, Notts. Registered office: Queen's Road, Barnsley.

Yorkshire Ignition Co., Ltd. (214,464).—Private company. Registered June 18th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of battery and magneto manufacturers, manufacturers of, and dealers in electrical ignition apparatus and motor accessories of all kinds, general and mechanical engineers, manufacturers of, and dealers in wireless instruments, &c. The first directors are:—L. S. Hargreaves, "Rosebank," Totley Brook Road, near Sheffield; C. O. Birtles, 264, Main Road, Darnall, Sheffield. Qualification, 150 shares. Solicitor: R. B. Grayson, 10, Figtree Lane, Sheffield.

Midland Tube Co., Ltd. (214,383).—Private company. Registered June 15th. Capital, £1,000 in £1 shares. The objects are to acquire the branch of the business of the Midland Tube and Forging Co., Ltd., relating to the manufacture and manipulation of tubes carried on at Bournbrook, Birmingham, and elsewhere, and to carry on the business of manufacturers and factors of, and dealers in metal tubes, conduit tubes for electric wiring and all kinds of apparatus, articles and accessories used in connection with the erection and fitting up of electrical installations, plant, and apparatus, manufacturers of, and dealers in cycles, motor carriages, and other vehicles, &c. The subscribers (each with one ordinary share) are:—J. H. Rice, 81, Oxford Road, Moseley, Birmingham, solicitor's managing clerk; G. J. Withington, "The Gables," Francis Road, Stechford, Birmingham, accountant. The first directors are to be appointed by the subscribers. No qualification required. Solicitors: Pinsent & Co., 6, Bennett's Hill, Birmingham.

H-S Electric, Ltd. (214,330).—Private company. Registered June 12th. Capital, £3,000 in 2,850 7 per cent. preference shares of £1 each and 3,000 ordinary shares of 1s. each. Objects:—To carry on the business of electrical engineers and contractors, manufacturers of, and dealers in electrical, magnetic, galvanic, and other apparatus, &c. The first directors are:—W. Holt, "Marmora," Goldieslie Road, Wylde Green, Birmingham; W. L. Sames, Ryde House, 227, Alcester Road, King's Heath, Birmingham; H. J. Fitton, "Gawsworth," Ridgeview Road, Whetstone, N.20 (director, Fitton, Smith & Co., Ltd.); and P. G. Marr, 59, Cheyne Street, Chelsea, S.W. (director of Fitton, Smith & Co., Ltd.). Messrs. Fitton, Smith & Co., Ltd., may, so long as they hold 65 per cent. of the ordinary shares, appoint all directors in excess of two, one of whom shall be chairman. Qualification of directors (except such nominees), 100 ordinary shares. Remuneration as fixed by the company. Registered office: 32, Charlotte Street, Birmingham.

Official Returns of Electrical Companies.

British Mica Co., Ltd. (72,187).—Capital, £5,000 in 2,000 preference and 3,000 ordinary shares of £1 each. Return dated June 10th, 1926. 885 preference and 2,194 ordinary shares taken up. £1,079 paid on 885 preference and 194 ordinary shares. £2,000 considered as paid on 2,000 ordinary shares. Mortgages and charges, £2,300 debentures and £650 mortgage.

F. W. Bland & Co., Ltd.—Particulars filed of £100 debentures authorised by resolutions of May 3rd and June 7th, 1926, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Napier-Kimber, Ltd.—S. H. Gillett, of 24, Basinghall Street, E.C.2, ceased to act as receiver or manager on June 9th, 1926.

Acme Production Co., Ltd.—T. G. Weavers, of 4, Drapers Gardens, E.C.2, was appointed receiver and manager on June 8th, 1926, under powers contained in mortgage debenture dated April 10th, 1924.

Reflex Radio Co., Ltd.—F. Davies, of 245, Kingsland Road, E.2, ceased to act as receiver or manager on May 27th, 1926.

C. J. Thursfield & Co., Ltd.—Satisfaction to the extent of £3,000 on June 7th, 1926, of debentures dated April 1st, 1912, securing £4,000.

L. Weekes, Ltd. (old company).—B. T. Crew, of George Street West, Luton, C.A., ceased to act as receiver or manager on May 31st, 1926.

Electrical Trading Association, Ltd. (formerly Nottingham Electrical Contractors' Trading Association) (208,897).—Capital, £1,000 in £1 shares. Return dated February 19th, 1926. 1,000 shares taken up. £1,000 paid. Mortgages and charges at date of return, nil. Since registered, debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated June 7th, 1926, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Contraflo Engineering Co., Ltd. (110,264).—Capital, £80,000 in £1 shares. Return dated February 5th, 1926. All shares taken up. £9,450 paid (being 7s. per share on 27,000 ordinary). £53,000 considered as paid on 53,000 shares. Mortgages and charges, nil.

H. J. Cash & Co., Ltd. (79,701).—Capital, £25,000 in £1 shares. Return dated March 9th, 1926. 15,000 shares taken up. £10,000 paid. £5,000 considered as paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Brush Electrical Engineering Co., Ltd.

The annual meeting was held on June 14th last, Mr. E. Garcke presiding. In proposing the adoption of the report, the chairman said that the total credits for the past year were £155,227, or about £1,000 more than in the preceding year. The total debits were £100,618, about £5,200 less. The proposed dividend of 10 per cent. on the shares, amounting to £45,856 less tax, was the same as they had distributed for each of the three preceding years; and there was a surplus of £8,751. The orders booked and executed during the year 1925 were larger in the aggregate than in the year 1924; moreover, they began the present year with a larger order list, so that the total volume of work done and in view was satisfactory. Their policy of confining themselves to definitely established types of manufacture continued to be justified. The popularity of the Brush-Ljungström turbo-generator grew from year to year and in the home market many installations had been completed during the year under review. There had been a decrease in the number of smaller equipments, due to the policy of the Electricity Commissioners in closing down or refusing extensions to certain of the smaller stations and compelling them to take their supply or part of it from larger stations. But during the year it had again been proved that many of those moderate-sized stations, when equipped with Brush-Ljungström plant, were able to generate their electricity at a figure lower than that at which they could purchase from the bigger stations and they were, in consequence, allowed to continue. At the same time, they had been preparing to meet the requirements for larger units. For example, they had during the year booked a contract for a set of 10,000-kW output, for St. Pancras. Their foreign market had also been increasing in a satisfactory manner and during the year installations had been completed or undertaken in India, the Malay States, South Africa, Australia and South America. In the transformer department the company had continued to make good progress throughout the year. In the foreign field their experience was that transformer prices were so keenly cut in many instances that the business was not worth while for them, so long as they were able, as they had been, to keep their shops fully occupied with moderately profitable home business. Nevertheless, they were able to keep their name well to the front in the foreign field by representative orders undertaken from time to time. Proceeding to deal with the proposed co-partnership scheme between the company and its employés, Mr. Garcke said that in the relations between labour and capital there were faults on both sides. The trade unions were organised to fight capital; the employers' associations were organised to fight labour. So long as that organised warfare continued there could be no real peace in industry. How was this deplorable state to be altered? It was no use any individual capitalist or individual worker holding up both arms between those opposing forces in the hope that, at his bidding, they would cease to fire. He would be crushed and it would be impossible to say whether by friend or foe. The time had come when on this subject they ought to be able to speak plainly without fear of giving offence. In the conferences of the two sides there was a disinclination to go to the root of the troubles. They heard many platitudes about goodwill, co-operation and mutual confidence. But the most important factor which was tacitly kept in the background was the fact that in every social problem in an old country they were buried up to the eyes in vested interests of every description, and no one could move without treading on somebody's toes, without disturbing the equanimity and balance of others. He, too, had his vested interests in electricity, and that was why he was opposing the vested interests of bureaucracy. The vested interests in the relations between labour and capital were represented by the powerful organisations on both sides which had been called into being as a consequence of large-scale production on a basis of economic doctrines devoid of moral interpretation. He had not a word to say against officials who recognised as their guiding principle the law of self-preservation. It was only a one-sided theorist who could say that the only principle in life to be observed was that of self-sacrifice for others—he had a noble and lofty text, but taken alone it had little validity and was no solution of their difficulty. On the side of the worker three things were needed—a fair reward for his labour, more security for continuous and permanent employment, and a higher status. On the side of the employer, the chief need was the removal of trade union restrictions upon increased output, so that a fuller use of toil-reducing machinery, and a more efficient and economic use of fuel energy could be made. Dealing with the company's proposals, he said that the directors did not make the mistake of presenting a cut-and-dried scheme. They met the trade unions, the federation of employers, and representatives of all the employés, both on the wages list and on the salaries list and said to them: "Here is a statement of the present position of the company and of the rights and obligations of the various parties interested in the company. If the principle of co-partnership has any value it must be capable of producing something more, something better, than the *status quo*. That something more we will call the surplus; and we will postulate as a basic principle that this surplus shall be distributed among all who have contributed to its production and we will discuss and collaborate on the details." Secondly, they said: "The employés will desire to have in addition to a fair share of the surplus also some voice in the welfare of the business which they are asked to promote. Therefore we propose to collaborate with you also on this point." The tentative scheme was the result of many discussions extending over nine or ten months, and he had every confidence that the proposed scheme would be accepted by the employés. They now asked the shareholders to say whether or no they approved the scheme in principle, or whether they wished any amendments to be made. If the meeting approved the scheme in principle, they would not be irrevocably committed to its adoption; they would refer it to a provisional Co-partnership Council. That Council would draw up a definitive scheme which would be submitted to the shareholders at a later date. Mr. W. Johnstone, in seconding the motion, remarked that from his knowledge of the employés he was convinced that they would carry out the proposed co-partnership scheme in a thoroughly loyal manner. After a short discussion, in which general approval of the proposed co-partnership scheme was voiced by the shareholders, the report was adopted.

W. T. Henley's Telegraph Works Co., Ltd.

The annual meeting was held on June 18th, Sir George Sutton, Bart., presiding. In moving the adoption of the report (*vide* our last issue, p. 924), the chairman, after referring to the death of Mr. Martin Roberts, who had been a director for 16 years, said the Tyre and Rubber Co. showed a very large increase in sales, but the year's work was not satisfactory from the profit point of view. Had there been stability in the market price of rubber that company would have shown a satisfactory profit for the year. With regard to the result of the year's work, it was the best in the long history of the company. Nearly all departments had been fully employed. The large expenditure on the works in recent years had made them capable of a large output, and the sales last year made a record. For the current year, the orders brought in were of greater value than they started the year with. Given peace in industry generally, they looked to the future with confidence. Their relations with their workpeople were excellent, but troubles in other industries had a direct detrimental influence on their business. The efficiency of their machinery and plant had been maintained at the highest level, and costs being reduced to the lowest practicable point, they were in as favourable a position as their British competitors to secure business. With regard to foreign competition, they had to meet conditions as to cost of labour and overhead charges which placed them at a disadvantage. They had done all they could to meet the difficulty, and further relief must come from an advance of labour rates in foreign cable factories and a reduction in our own taxation. Referring to the financial policy of the board, he said that, as he had told them at previous meetings, their first consideration was the stability of the undertaking, the conserving of the capital, and dividends were made subservient to that. He had said that they need not think that the dividend would never be raised because it had remained the same for several years; but that when the directors were satisfied that they could safely

raise it they would do so; and they had redeemed that promise this year. The cash available, including British Government stock, was £425,000. It was a large sum, but it fluctuated considerably in the course of a year, and was not too large to provide for all reasonable eventualities. Electrical manufacturing was continually developing new methods which made new demands for capital expenditure for new processes and machinery. There was a large carry forward, £503,000; that, of course, was in the nature of a reserve. They could transfer it to the reserve account and change a part into shares as a bonus to the shareholders without depleting their cash. They did not see any advantage in doing that. They believed the wiser course was to pay an increased dividend if they could earn it, and that was the course they had adopted this year. There could hardly be a manufacturing undertaking in the British Isles which had a stronger financial position than their business, which this year had reached 35 years of unbroken dividend record. In concluding, Sir George referred to his approaching retirement as managing director. This year, he said, he had completed 45 years of active service. He had not come to his decision to retire without mature consideration. He felt that he should not alter that decision, and that the interests of the business would be best served by his retiring from the managing directorship at the end of September next. It was the desire of the board that he should remain in the company's service as an active chairman, having his place at headquarters and keeping in touch with the company's many activities, and that he had agreed to do.—Mr. W. J. Potter seconded the motion, and the report was adopted.—Subsequently a sum of £500 was voted to each director as a special bonus on account of last year's results, and a cordial vote of thanks was accorded the chairman, directors, and staff.

Telephone Manufacturing Co., Ltd.

The annual meeting took place on June 17th. Mr. F. T. Jackson, who presided, said that the combined accounts of the subsidiary companies showed a profit of £73,822 for the year, subject to depreciation and taxation, as against £68,576 in the preceding year. The net value of the Installation Companies' properties was £315,586, from which a revenue of £124 489 was derived. The annual rentals credited to revenue account rose from £111 1 to £113,629. It had to be borne in mind that the company's policy was to maintain the position as to revenue, and capital expenditure had been limited to that end. The chairman then dealt with the accounts of the parent company, which were reviewed in our last issue (p. 924), and said that their investments in the French and Belgian companies had been written out of the balance-sheet. The whole of the contingency reserve (£32,000) might not be required, in which case a portion would be available for general reserve. During 1925 the Belgian company was able to pay several thousand pounds off its past indebtedness. Very little new capital was required; the purpose of the new financial scheme was to convert their bank and bond indebtedness into capital of a permanent nature. The scheme had been approved by a very large majority, and they could now look forward to a future untrammelled by the load of debenture and interest charges which had burdened them in the past. A sum of £80,000 per annum would thus be released for working capital, or, they hoped, for dividends. The reorganisation of the capital had already had a marked effect upon the business. The orders in hand and in sight would be sufficient to cover their overhead expenses for 12 months, leaving practically the whole of the gross profit from further orders available for reserves or dividends. The factory which for three years had been too large for their limited financial resources was fully equal to turning out the greater volume of work which was now coming their way. His confidence in the future was complete. The report and accounts were adopted.

Oriental Telephone and Electric Co., Ltd.

The report of the directors for the year ended December 31st last records a net revenue of £67,017. After adding £11,889 brought forward and deducting interim dividends, there remains a balance of £55,141, out of which the final preference dividend is to be paid and a final dividend of 6 per cent., plus a bonus of 2 per cent., free of tax, on the ordinary shares, leaving £14,218 to be carried forward. The business of the Singapore branch continues to progress steadily, but there was again a loss on the Mauritius branch. The Mauritius Government has held an expert inquiry, and it is hoped that the result will be an outlet from the present impossible situation. The Bombay Telephone Co., Ltd., recorded an increase in the number of subscribers, but the results did not permit of the declaration of a dividend. Since the last report, however, considerable economies in administration have been effected. The Oriental Company has taken up Rs.6,66,150 8½-per-cent. mortgage debenture stock in the company. Other companies in which the Oriental Company is "interested" have paid the following dividends:—Madras Telephone Co., Ltd., 7 per cent., free of Indian income tax; Rangoon Telephone Co., Ltd., 8 per cent., free of Indian income tax; China and Japan Telephone & Electric Co., Ltd., 20 per cent., plus a bonus of 10 per cent., both free of tax; and Hongkong Telephone Co., Ltd., at the rate of 8 per cent. per annum for the first six months of its working. The death of the chairman, Sir George S. Gibb, is recorded, and it is stated that Sir A. H. McMahon, G.C.M.G., has joined the board as chairman. Meeting: June 29th.

Whitehall Electric Investments, Ltd.

Presiding at the annual meeting on June 17th, the Hon. Clive Pearson (chairman) said that the increased net income had permitted of the payment of a 2½-per-cent. dividend on the ordinary shares and the reduction of discount on debenture stock; within the next two years the latter item should be completely eliminated. The Cia. Chilena and the Cia. Valparaiso were maintaining good progress. In four years their sales of energy had risen from 55 to 120 millions of kWh. The 47,000-kW plant was already fully loaded, and plant with a capacity of 22,000 kW which was being installed would be in the same position shortly after its inauguration. The Santiago tramway properties had been transferred to a new subsidiary of the Chilena Company, and the net earnings had shown a moderate increase. Improvements were in hand, and the new company was also to operate the power and light distribution system in Santiago. The return in Chile to constitutional government and to a gold standard had led to improvements which would benefit traders. The net operating results of the Mexican companies had shown a considerable advance over those of 1924, although they were still below the 1922 level. The company's investments did not appear to be affected by the new Alien Law in Mexico, but further investment might be affected. In conclusion the chairman expressed his confidence in the future of the company.

Madras Electric Supply Corporation, Ltd.

Mr. James Gray (chairman) presided at the annual meeting on June 16th and in presenting the report and accounts (*vide* ELEC. REV., June 11th, p. 883), said that the results were not striking but they showed the continuation of the company's steady improvement. The 6 per cent. first mortgage debentures had been entirely redeemed out of an issue of 5½ per cent., tax-free, preference shares. The debenture sinking fund contribution had consequently been transferred to the depreciation and renewal account, which, after writing off debenture and preference share issue expenses, stood at £123,836. During the year additions had been made to sub-stations; new boilers and generating sets had been installed; and further converting plant, switchgear and cable, had been provided. Agreements had been concluded with the Madras and Southern Mahratta Railway Co. and the Madras Harbour Trust for the provision of large supplies of electricity, but some time would elapse before those supplies commenced and the company felt the benefit of them. The additions at the power station would keep the company in advance of the demand. The sanctioned capital had been exhausted and it would be necessary to increase the capital at no distant date. A dividend of 6 per cent., free of tax, had been received from the Madras Electric Tramways (1904), Ltd., but the company's receipts had been affected by motor-omnibus competition, which, however, was being countered by the tramway company's own 'bus services. The report and accounts were adopted.

United Electric Tramways of Montevideo, Ltd.

The report for the year ended March 31st last states that the operation of the tramway system for the year 1924-25 resulted in an increase of the gross receipts by £13,438 to £678,100. The profit and loss account shows a credit balance of £79,294, and to this is added £7,222 brought forward, making £86,516. Interim dividends absorbed £12,000, capital redemption allocations have been made to the extent of £10,204, and £27,223 has been provided for depreciation and renewals, and after paying the final preference dividend it is proposed to pay a dividend of 4 per cent. on the ordinary shares, leaving £9,088 to be carried forward. The passengers carried by the tramway system increased from 80,074,936 to 81,544,137, but the car miles run were reduced by 205,307 to 11,003,731. The installation of additional plant at the power house was completed during the year, and a new 3,750-kW turbo-alternator was put into service in November last. Two new sub-stations were completed, and two more are in hand. The question of an increase in fares is under consideration. The meeting is to be held to-day (Friday).

Underground Electric Railways Co. of London, Ltd.

The long-awaited scheme for the reorganisation of the share capital was published last week. The present issued capital consists of 500,000 ordinary shares of £10 each (fully paid) £5,000,000, and 1,198,980 "A" ordinary shares of 1s. each (fully paid) £59,949, making a total of £5,059,949. It is proposed that the capital shall be reorganised and increased so as to be £5,068,878 divided into 5,068,878 ordinary shares of £1 each all ranking *pari passu* and each carrying one vote on a poll at general meetings. This will be effected as follows:—(*a*) The existing 500,000 £10 ordinary shares shall be subdivided into 5,000,000 £1 ordinary shares; (*b*) Of these 3,550,000 shall be retained by the existing ordinary shareholders and the remaining 1,450,000 shall be surrendered to the company and be available for re-issue; (*c*) All the 1,198,980 issued "A" ordinary shares of 1s. each shall be surrendered to the company and consolidated into 59,949 ordinary shares of £1 each and be available for re-issue; (*d*) 8,843 new ordinary shares of £1 each and 4 new ordinary shares of 1s. each shall be created; (*e*) The 1,716 unissued "A" ordinary shares of 1s. each in the present capital and the 4 new ordinary shares of 1s. each to be created shall be consolidated into 86 ordinary shares of £1 each. In addition to re-arranging the capital the scheme will cancel the contingent certificates and thus consolidate the interests of those persons who have contingent rights in the

undertaking with the interests of the shareholders, thereby eliminating a charge, even though it may be a remote one, upon the future profits. The effect of the scheme is that the £10 ordinary shareholders are asked to sacrifice a portion of their capital rights in return for slightly increased rights in the distribution of profits and the "A" ordinary shareholders to sacrifice a portion of their rights in the distribution of profits, in order that they may in future rank, *pari passu*, with the present £10 shareholders in the distribution of capital. A comparison between the present and proposed appropriation of profits available for dividend, is as follows:—

	Proportion of Profits.	
	Present. Per cent.	Proposed. Per cent.
To the present £10 ordinary shares ...	66.66	70.03
To the present "A" ordinary shares ...	33.33	26.02
To the contingent certificates	—	3.95

The directors are taking steps to raise the money which is required for paying off the temporary bank loan, acquiring further interests in some of the subsidiary companies, and for other capital purposes. Extraordinary meetings are to be held on July 29th for the purpose of considering the proposals and approving them if thought fit.

French Companies.

The *Société d'Eclairage et Force* proposes to pay a dividend at the rate of 40 fr. per share, as compared with 50 fr. in 1924, the share capital participating being considerably greater than in the previous year.

The *Union d'Electricité* records an increase in the net profits, from 15,354,000 fr. in 1924 to 18,372,000 fr. last year. The dividend is at the rate of 20 fr. (8 per cent.) per share, as compared with 17.50 fr. in 1924.

The *Compagnie Parisienne de Distribution d'Electricité* reports gross profits of 82,388,000 fr. for 1925, as against 62,692,000 fr. in the previous year. Including the balance forward the accounts show net profits of 37,409,000 fr., permitting of the payment of a dividend of 65 fr. per share, as against 60 fr. in 1924.

The report for 1925 of the *Compagnie de Forges et Ateliers de Constructions Electriques de Jeumont*, whose financial results were recently recorded, states that, despite the economic crisis, the different departments continued to be well provided with orders, and their activity was greater than in the preceding year. At the end of 1925 the manufactures still to be invoiced represented a value of over 100,000,000 fr. The various subsidiary companies in France, Belgium, and other countries also yielded satisfactory results.

Norwegian Company.

The *Norske A.S. for Elektrokemisk Industri*, reporting on the year ended March 31st, 1926, states that the business made satisfactory progress in the individual departments. On the other hand, the situation of the exchange had an adverse effect. The chief receipts are paid direct in gold values, and these receipts, converted into Norwegian kronen, declined in accordance with the rise in the value of the krone. It is proposed to apply the surplus of 25,000 kr. for 1925 and the reserve fund of 236,000 kr. for the purpose of writing down investments upon which a loss has been incurred. The electrode branch still occupies the first place in the business; 11 new licences have been granted for the use of the Soderberg electrode so that contracts have now been entered into with 51 works. Contracts on a larger scale have been concluded with aluminium works for the introduction of electrodes, this branch having so far progressed as to have become quite an international business. Among the participations reference is made to the A.S. Kinsarvik, whose shares held by the Elektrokemisk Industri are now being disposed of to the Aluminium Company of America.

Swedish Company. — The *Svenska Akkumulatoraktiebolaget Jungner* reports a net profit of 201,000 kr. for the last financial year, as compared with 137,000 kr. in 1924. The directors proposed a dividend of 3 per cent. on the ordinary shares, as against 6 per cent., and 14 per cent. on the preference shares, as compared with 11 per cent.

Swiss Company.—The directors of *Brown, Boveri and Company*, Baden, recommend an increase in the dividend from 6 per cent. for 1924 to 7 per cent. for last year.

Czecho-Slovakian Company.—The *Krizik Electrical Engineering Co.*, of Prague, reports a net profit of 7,799,720 crowns for last year and is declaring a dividend of 5 per cent.

Burndept Wireless, Ltd.—The company's first report, covering 10 months ended December 31st last, states that the "slump" which was experienced prevented the company from maintaining or increasing its turnover, and in spite of the exercise of drastic economies, which were too late to affect the period under review, there was a loss of £3,563, and therefore no dividend can be paid. In February the directors entered into negotiations for the amalgamation of the company with two other leading radio and electrical companies, but the general strike intervened and the necessary financial support was not forthcoming, and negotiations were discontinued. Lord Lurgan and Mr. G. E. Duveen have resigned from the board, and Messrs. J. B. Close, H. I'Anson Jones, and C. F. Trippe have joined it. Sir C. G. C. Hamilton has been elected chairman. Meeting: July 16th.

Sevenoaks and District Electricity Co., Ltd.—After providing for depreciation (£3,500) and paying the interim preference dividend there is a net profit of £3,529. It is proposed to pay the final preference dividend, one of 7 per cent. on the ordinary shares, and to write off £1,639 against development account, &c., leaving £821 to be carried forward. During the year further capital was raised by an issue of preference shares; this has been used principally in the extension of the company's mains. Further extensions are necessary, and proposals for raising the additional capital required were to be placed before the shareholders at the annual meeting on Wednesday last.

Globe Telegraph and Trust Co., Ltd.—The directors' report for the year ended May 31st shows a net revenue of £337,110, to which is added £51,222 brought forward, making £388,332. From this amount £15,000 has been transferred to the reserve for contingencies and interim dividends absorbed £241,756, leaving £131,576, which is to be distributed as follows:—Final dividend on the preference shares and 5s. per share on the ordinary shares, free of tax, making 10 per cent., tax-free, for the year, leaving £80,991 to be carried forward. The report records the retirement of Sir Robert M. Kindersley from the board and the appointment of the Hon. A. G. V. Peel in his place. The meeting was held on Tuesday last.

Edmundsons' Electricity Corporation, Ltd.—The net profit for the past year, after providing for debenture charges and taxation, amounts to £84,431, as against £74,784 in the preceding year. To this is added £15,159 brought forward, making £99,590. After paying interim dividends there remains a balance of £73,590, which it is proposed to allocate as follows:—To reserve account, £20,000; final preference dividend, £14,000; final dividend of 5 per cent. on the ordinary shares (making 8 per cent. for the year), £20,000; carried forward, £19,590. The meeting was held on Wednesday last.

Ransomes, Sims & Jefferies, Ltd.—The profit balance for the past year, including £56,630 brought forward, is £144,599. From this £25,000 is put to a special reserve against strike losses, £25,000 is transferred to the ordinary reserve, and a dividend of 5 per cent. is to be paid on the ordinary shares, leaving £58,599 to be carried forward.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted:—

Madras Electric Supply Corporation.—23,600 5½ per cent. (free of income-tax) preference shares of £1 each fully paid, Nos. 303,201 to 326,800 (cumulative).

Reading Electric Supply Co.—£150,000 6 per cent. first mortgage debenture stock.

James Keith & Blackman Co., Ltd.—The report for the year ended March 31st last records an increase in the volume of orders received. The available balance is £31,272, out of which it is proposed to pay a dividend of 10 per cent. on the ordinary shares, to transfer £5,000 to reserve, and to carry forward £10,272. The meeting is to be held to-day (Friday).

British Columbia Telephone Co.—The available balance from the past year's working was $738,302, as against $667,688 in the preceding year. A total dividend of 8 per cent. has again been paid on the ordinary shares, $50,000 is contributed to the pension fund, $80,000 to fire and loss reserve, and $83,387 is carried to surplus.

Para Telephone Co., Ltd.—The profit for the past year was £4,570, and the addition of £6,454 brought forward makes £11,024 available. A dividend of 3 per cent. is to be paid (against *nil* for 1924), £5,000 is allocated to depreciation, and £3,924 is carried forward.

John Brown & Co., Ltd.—The directors consider it inadvisable to pay an ordinary dividend out of the disposable profit of £279,683. They are accordingly paying the final preference dividend and carrying forward £192,183. The previous year's ordinary dividend was 5 per cent.

Reduction of Capital.—DICTOGRAPH TELEPHONES, LTD., AND REDUCED.—A petition for the confirmation of the reduction of the capital of the above-named company from £80,000 to £61,000, has been presented to High Court and will be heard in London on June 25th.

Cape Asbestos Co., Ltd.—The profit for 1925 was £26,485, and the addition of £6,237 brought forward makes £32,722. It is proposed to pay 10 per cent. on the ordinary shares and a further dividend equal to the ordinary dividend on the preference shares. £10,491 is carried forward.

Richard Johnson, Clapham & Morris, Ltd.—Out of a net profit of £5,262, plus £8,080 brought forward, making £13,342, the directors propose to pay the preference dividend and to carry forward £8,199. Meeting: June 26th.

Edgar Allen & Co., Ltd.—The directors propose to pay a dividend of 1s. per share, free of tax, on the ordinary shares out of the profit and amount brought forward, totalling £70,775.

Northern Mexico Power and Development Co.—A preference dividend of 1¾ per cent. has been declared in respect of the current quarter.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—A quarterly dividend at the rate of 10 per cent. per annum has been declared.

International Light and Power Co., Ltd.—A dividend of 3 per cent. has been declared on the preference shares in respect of the half-year ending June 30th.

Stocks and Shares.

MONDAY EVENING.

THE principal feature this week in the markets for electricity companies' shares is the publication of a scheme dealing with the Underground Electric Railways of London. Readers of these notes have probably grown weary of the constant references made over the past half decade to the anticipations of the finances of this company being taken in hand in an endeavour to unify the diverse interests which prevail. When the American exchange stood so much against this country, it was impossible for anything to be done, owing to the fact that the company's income bonds are redeemable at par, payable in American as well as in other currency. Coupons, it will be recalled, became saleable at a premium, and were, indeed, so negotiable until fairly lately. Now that the American exchange is practically normal, the Underground Electric Railways of London board is able to approach the matter without being handicapped by this factor.

A plan has been evolved, which is to be submitted to the proprietors at a meeting next week, whereby the £10 ordinary, the "A" shares and the contingent certificates will be brought into something like line. Keen criticism has already arisen from holders of the "A" shares and market disappointment with the terms is reflected in the sharp fall in prices. The board has not yet announced what it intends to do in regard to the 6 per cent. income bonds, the price of which remains at 101. It is hoped that the directors' statement will include an estimate of what prospect there is for an early payment of dividend on the shares. The £10 at 3½ are 10s. down, while the 1s. shares, which were 12s. 6d. about ten days ago, have reverted to half a guinea. Districts are better at 54, on the contention that the stock looks reasonably-priced when compared with the current quotations for Underground shares. Metropolitan Consolidated at 65 is ½ higher.

The electricity supply market is inclined to be better. Rises have occurred in City of London ordinary and preference. Countys are 1s. up. Edmundsons both gained 1s. and Notting Hill preference rose 10s., to their par price of £10. The demand for stocks and shares in every part of the House continues to be on a large scale, and any security which offers good value is eagerly taken. Jobbers state that stock is not allowed to remain long on their books. New issues are subscribed with remarkable facility.

There is about £5,000 6 per cent. first debenture stock of the Lancashire United Transport & Power Company which can be obtained at 92. This represents a discount of 1 per cent. on the issue price of 93. A partial payment of interest is due in January next. On the present price the yield comes to 6½ per cent. on the money. The amount required for interest annually is £15,000, and last year's available profits were £43,000. No dividends have yet been paid on the shares, of which there are issued 193,000 ordinary of £1 each fully paid, and which at present are worth very little.

Cable stocks and shares are again better, the Eastern group leading the way. With the exception of Great Northern Telegraphs, which are down 10s., the whole of the list shows improvement. Easterns are up to 182½, Eastern Extensions to 18¼. Westerns are still relatively the cheapest of the group, and stands at 17⅞. Anglo-Argentine preferred continues to improve, advancing to 104½. Oriental Telephones are better at 45s., on the issue of the report.

United River Plate hold their rise at 8. Expectation, of course, is looking for an issue of new shares at some price that will provide a bonus. It may be well not to build too much hope upon this at present, as the new issue is hardly likely to be made before the autumn. Before then, it is likely that the Telephone Manufacturing Company may place 10s. shares on the market. In fact, the possibility of an issue of this sort being made, comes within the near future. Marconis are quiet. Burndepts have fallen, owing to the issue of a disappointing report.

Mexican stocks and shares of all kinds are better, on the statement that the Mexican Government is going to pay some of the coupons due on July 1st. This confirms the nebulous impressions that have been afloat for the past few weeks, and to which reference has already been made here. Mexican Light & Power, and the Mexico Tramways issues are all better. Amongst other dollar stocks, Shawinigan Water receded to 200. Submarine Cables Trust gained 5 points to 265.

Prices of manufacturing firms are firm, with rises in British Aluminium, Callenders, General Electric preference and Telegraph Constructions. On the other hand, Metropolitan-Vickers ordinary at 23s. 9d. and Babcocks at 51s. show declines. The dragging out of the coal dispute is making its influence felt in certain directions, though nothing like the extent to which it might have been expected to do. Business throughout the Stock Exchange is fairly active. There is a good deal going on in speculative investment stocks, while the prices of sound securities continue steadily to mount. Rubber shares have enjoyed a spurt, although the price of the raw produce remains about 1s. 9d. per lb.

Southern Counties Electric Light & Power Supply, Ltd., is circularising with prospectuses of 8½ per cent. preference shares, ordinary shares and first mortgage debentures. The chairman of the company is Sir Charles B. H. Soame, Bart. Readers of the ELECTRICAL REVIEW probably require no reminder that this is a company whose issues are best left severely alone.

The Incorporated Municipal Electrical Association.

Annual Convention at Glasgow.

(*Continued from page* 927.)

In spite of the adverse conditions that prevailed, the Convention opened with every indication of success. There was a large attendance at St. Andrew's Halls on Monday evening, June 14th, to meet the President and Dr. D. McK. Dewar, and an enjoyable evening was spent in an informal fashion. Besides music and dancing, there was a very good display of kinema films,

Starting from St. Andrew's Halls for Alexandra Park.

The Ladies "entraining" for the Electrical Exhibition.

organised by the E.D.A., which attracted an interested "audience."

At the formal opening of the Convention on Tuesday morning, the Lord Provost, Sir Matthew W. Montgomery, in welcoming the members on their third visit to Glasgow, emphasised the importance of cheapening the price of electricity as the main factor of successful development; in Glasgow, he said, electricity was as cheap as anywhere else, or cheaper, but they must endeavour to reduce the price still further. Referring to the Electricity (Supply) Bill, 1926, he asked whether it would have that effect; if so, he would welcome the Bill, but he thought Glasgow was big enough to look after its own electricity supply, and he expressed the hope that nothing would be done which would in any way interfere with the expansion of the Corporation's electrical undertaking. He referred in eulogistic terms to the high merits of the City electrical engineer, Mr. R. B. Mitchell, who thanked the Lord Provost for his words of welcome to the I.M.E.A., and afterwards delivered his presidential address, an abstract of which appeared last week.

Mr. S. E. Britton, M.I.E.E. (Chester), then read his paper on "Supplies to Outlying Districts," in abstract, and after the discussion, which is reported on pp. 973-4, the members assembled in the Grand Hall, where they were entertained to luncheon by the Lord Provost, Conveners, and members of the Electricity Committee of the Glasgow Corporation. After the loyal toast had been honoured, the toast of "The Corporation of the City of Glasgow" was proposed in a humorous speech by Ald. E. Huntsman, chairman of the Nottingham Electricity Committee, and was responded to by the Lord Provost.

Photographing the "Group" in the Park.

The President and Mr. A. W. Blake at Dalmarnock.

From the Hall the members were conveyed to Alexandra Park in a procession of charabancs so lengthy that it occasioned a considerable sensation in passing through the heart of the city to the east end; the traffic,

however, was admirably handled by the police, whose methods were observed with interest. In the park a group was formed on the terraced slope in front of the bandstand, and several photographs were taken, the process occupying considerable time owing to the painstaking care of the artist. A move was then made to the Dalmarnock power station of the Corporation, over which the visitors were conducted by members of the staff. Some particulars of this fine station will be found in our last issue; it has now, with the recent extensions, a maximum continuous capacity of 131,250 kW, and a maximum overload capacity of 147,000 kW, the ultimate capacity contemplated being 200,000 kW.

Some Members of the I.M.E.A. at Gleneagles Hotel.

The boiler-house efficiency is about 78.5 per cent., that of the turbine house 23.7 per cent., and that of the whole station 18.3 per cent. on the basis of generated energy. The best daily efficiency recorded is 20.5 per cent., and the estimated overall efficiency of the plant in the new section of the station is 22.5 per cent. The maximum load on the station last winter was about 90,000 kW, and the demand applied for is over 230,000 kW. The output in 1925 was 220 million kWh. The plant was inspected with great interest, and the leading particulars were imparted to the visitors in the form of an admirably produced souvenir brochure.

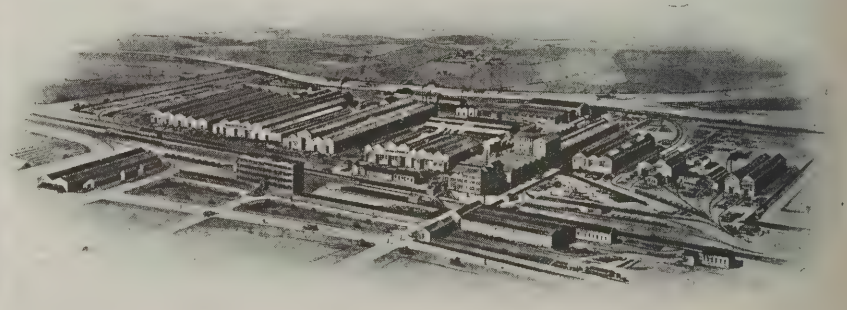
One of the new Parsons turbo-alternators gave, on test, the following results for steam consumption:—

18,750 kW, 9.609 lb. per kWh,
15,000 kW, 9.215 lb. per kWh,
11,250 kW, 9.444 lb. per kWh,

the true mean for the three loads mentioned being 9.379 lb.; the guaranteed figure was 9.73 lb., upon which a notable improvement has therefore been made. At 21,000 kW the consumption was 9.803 lb.

In the evening the Lord Provost and magistrates held a reception in the magnificent salons of the City Chambers. There was a large attendance, and a very happy evening was spent, the entertainment including music and dancing, and an excellent concert rendered by Mr. Thorpe Davie's choir. The dancing of the reel was watched with great enjoyment, especially by the many members of the "subject race south of the Border" who were present, and the hospitality of the Corporation was thoroughly appreciated, although, in accordance with the self-denying ordinance recently adopted by that body, all municipal functions are "dry."

On Wednesday the first business was the reading and discussion of a paper on "Operating Costs of Electric Battery Vehicles," by Mr. C. W. Marshall (Glasgow), which is abstracted on a later page. A number of the electric vehicles used by the Glasgow Corporation were paraded outside the Hall at the end of the meeting.



In the afternoon an early start was made by special train to the Renfrew works of Messrs. Babcock and Wilcox, Ltd.; the weather conditions were very unpleasant, but did not prevent the visitors from enjoying the tour through this huge establishment, which occupies nearly 100 acres. It was interesting to learn that, owing to the forethought of the management, the factory had not had occasion to shorten the working hours or restrict its operations during the shortage of coal; the boilers, air-heaters, superheaters, conveyors, and cranes in course of manufacture were inspected with great interest. It was noticeable that many of the boilers were designed for very high pressures, with shells $1\frac{3}{4}$ inches in thickness, and the accuracy with which the parts were made was a marked feature of the work, the large rings being turned all over.

The projected steamer trip in the Firth of Clyde being impracticable owing to fuel restrictions, an admirable alternative was found in a visit to Gleneagles, whither the members were conveyed in two special L.M. & S. trains, tea being served *en route*. Fortunately the weather improved in the course of the afternoon, and on their arrival at the "Eighth Wonder" the visitors were able to enjoy a round on the famous golf links or to walk to points whence the splendid views of the mountains and the beautiful country surrounding the hotel could be enjoyed. Dinner was served in the ball room of the hotel, at the invitation of Messrs. Babcock and Wilcox, Ltd., and the President took the opportunity of expressing the members' appreciation of the lavish hospitality of that Company; Sir James Kemnal, to whom a hearty vote of thanks was accorded, with musical honours, briefly acknowledged the compliment.

On Thursday morning a paper on "Industrial Heating," by Messrs. A. P. M. Fleming and J. H. Crossley (Metropolitan-Vickers Electrical Co., Ltd.), was read and discussed, and in the afternoon the chairmen and the engineers respectively held their private meetings.

The Rainy Day, at Renfrew.

The B. & W. Boiler Works, Renfrew.

A special meeting for women, arranged by the I.M.E.A. in collaboration with the Electrical Association for Women, also took place in the afternoon, at which Dr. Christina Barrowman delivered a lecture on "The Remedial Uses of Electricity," with interesting demonstrations; afterwards a move was made to the Electrical Exhibition, where tea was served.

(*To be concluded.*)

Electricity Supply to Outlying Districts.

By S. E. BRITTON.—*Abstract.*

(*Concluded from page 930.*)

For the present purpose it is assumed that transmission at 6,600 volts can economically serve thinly-populated areas having a radius of about six miles, say 120 square miles, and proportionately smaller areas depending on the magnitude of the demand, and that the largest areas which can be dealt with at higher pressures are as follows:—

11,000 volts, radius of 10 miles, say 300 square miles.
22,000 volts, radius of 20 miles, say 1,250 square miles.
33,000 volts, radius of 30 miles, say 2,800 square miles.

The demand for low-voltage electricity in rural areas is unlikely to exceed the capacity of low-pressure sub-stations equipped with 100-kVA transformers, except in rare cases.

Individual demands of 50 kVA and upwards can usually be most cheaply supplied by taking the high-voltage supply to the consumer. Several tables are incorporated in the paper giving the comparative costs of various components of a rural supply system, to meet specified conditions.

Table 1 shows that the cost of an indoor sub-station of 100 kVA ranges from £525 for 6,600/440 V to £1,250 for 33,000/440 V; the outdoor type similarly costs from £225 to £460.

Table 2, relating to a 0.1-sq. inch line, shows that underground cables laid and buried cost from £2,000 per mile at 6,600 V, to £3,300 at 33,000 V. Overhead lines for the same conditions cost from £965 to £990, with wooden poles.

Table 3, for low-pressure 4-wire distributors, covers the range from 3×0.035+1×0.029 sq. inch overhead conductors, at £550 per mile, to 3×0.082+1×0.042, costing £685; underground cables of similar capacities cost about twice as much.

Table 4 relates to low-pressure 2-wire service lines of various lengths and sizes. A 40-foot service, 0.0225 sq. in., costs 105s. underground, whilst an overhead service of 0.020 sq. in. costs 62s.

Table 5 compares complete transmission systems, including 100-kVA sub-stations three miles apart, for 100 consumers, with six miles of 4-wire low-pressure distribution, at transmission voltages of 6,600, 11,000, 22,000, and 33,000 volts. Data are given for underground cables with indoor sub-stations, and for overhead lines with outdoor sub-stations, using steel poles or wooden poles. In the case of underground cables of 0.04 sq. in., the average cost per inch at 6,600 V is £2,103; at 11,000 V, £2,258; at 22,000 V, £3,328; at 33,000 V, £3,628. With overhead lines, using steel poles, the conductor section being 0.035 sq. in., the average cost per mile at 6,600 V is £1,124, increasing to £1,185 at 33,000 V; with wooden poles the figures are £1,073 and £1,175 respectively.

Table 6 (the first two sections of which are reproduced below) gives the average price per unit required to meet the charges (1) with secondary transmission and distribution by underground cables; (2) with transmission and distribution by overhead lines on wooden poles; also the percentage increase required in the income per unit to meet the charges on the underground system compared with overhead lines on wooden poles.

TABLE VI.

The problem of supplying outlying districts therefore resolves itself into preparing a scheme, the cost of which can be met by the inhabitants of a particular village, or thoroughfare, or individual. A convenient method of allocating the revenue required from those who are to be supplied from the distributors of a single sub-station is to distribute equally the amount of income required to the total assessable value of the premises to be supplied, and then determine to what extent the inhabitants of the particular locality can afford to pay for the service it is proposed to give. This can be tested by a circular letter to the occupiers of the property, accompanied by a postcard for a reply. In the Chester rural area of supply the income required varies from 6s. to 12s. for each £1 of assessable value of buildings. Electricity for lighting only is approximately no more costly than oil lamps when the cost does not exceed 8s. per £1 of assessable value.

A substantial percentage of the inhabitants in rural districts cannot be supplied at a price which would at once be remunerative to the suppliers and attractive to the supplied. The economic area of supply will, however, be automatically enlarged when electrical legislation and the rules and regulations for overhead lines are amended so as to be in accordance with practical requirements, remote contingencies being left to take care of themselves. Obviously, a supply of electricity to outlying districts cannot be inaugurated and operated successfully for some time, if at all, or a cheap supply given, if the electricity is purchased and distributed in small quantities by a local authority, company, or person.

The secret of successful supply to small and scattered communities in outlying districts would appear to lie in the encouragement of existing authorised undertakers to extend their distributing systems to the widest possible limits. It is to bring about this state of affairs and to remove rules and regulations which now make it impracticable to carry electricity into many of the outlying districts, owing to the cost, that legislators should devote themselves.

If the provisions of the 1926 Bill are adopted by Parliament, private interests will acquire the territory which is not held under statutory powers by authorised undertakers. The distribution and use of electricity will, in future, make greater progress in the hands of enterprising local authorities than in those of companies and persons, especially where the local authority declares that it will not take any surplus monies from the undertaking for the relief of the rates, establishes an attractive showroom, and undertakes wiring and the supply of electrical apparatus. Consumers and prospective consumers have instinctively more confidence in, and prefer to obtain all their requirements from, a municipal authority than from a dividend-paying undertaking.

Discussion.

Mr. W. A. TURNBULL (Aylesbury) said he was supplying electricity for a distance of 10 miles around and was running three transmission lines. One line had been operating at 11,000 volts for 18 months. As to wayleaves, he did not study the legal aspect too much, but endeavoured to come to agreements with the landowners; if it was quite impossible to come to terms, then there was nothing to be done but wait until compulsory powers could be obtained. He had been able to construct lines more cheaply than was indicated in the paper; for instance, he was putting down an underground 0.075 sq. in. 11,000-volt cable at £1,323 per mile, compared with £2,300 mentioned by the author for a 0.1 sq. in. cable. He was putting up an overhead 0.075 sq. in. cable at a cost of £520 per mile, against Mr Britton's £875 for 0.1 sq. in., and there was not much saving between 0.075 and 0.1 sq. in; it was not economic, however, to go below 0.075. He had got out a design for a galvanised 7/12 steel-wire cable of 45 lb. quality, and with 400-ft. spans was putting it up for £295 per mile; it would carry 300 kW for a distance of 5 miles with a 5 per cent. drop. A better proposition, however, would be a copper-clad high-tensile steel wire, which would enable greater spans to be used, but at present it was not being manufactured in this country, although he hoped it soon would be. He warned Electricity Committees against expecting to economise on the staffs for carrying out rural schemes, because there was a great deal of work to be done in calculating the sags and stresses.

Mr. R. W. L. PHILLIPS (Bedford) said the Bedford Corporation had recently increased its electricity supply area 100-fold and he contended that such councils as his were the right people to supply the surrounding districts, in preference to the supply being given from the big "grid-iron" scheme of which so much had been heard. There was, he said, very little difficulty in getting Special Orders for giving such supplies, and his experience had been that the outside authorities much preferred to deal with a neighbouring municipality than with a power company.

Mr. R. BORLASE MATTHEWS said that 18 months ago there were 200 farmers in this country using electricity, but to-day there were over 600. There was much cheap and nasty overhead construction on the Continent, but, at the same time, the standards of this country were too high and it was only by improved design that the end in view would be accomplished; by that he meant that most of the work on the poles would have to be done in the factory so that the poles could be put up in any position on the site and reduce the cost of alignment; the cross arms and bearers should be clamped on and not drilled, so saving expense again. In connection with wayleaves, it was common practice on the Continent to have a schedule of prices. The owner of any land could call for an inquiry and, if he did so, the assessors would also assess his land in respect of betterment consequent on electricity being brought into the area. It obviously made the land more valuable so that the owner of the land had really to contribute something towards the cost of wayleaves. After carefully studying the suggested amendment of the low-voltage overhead-line regulations which the I.M.E.A. had placed before the Electricity Commissioners, he felt that they were still too drastic and that too high a standard was set, at any rate for the future if not for the present. There were too many regulations, and they ought to be left alone; there should be no necessity for submitting every calculation for approval in connection with lines of which the engineering principles had already been settled. Users in rural areas would rather put up with a little less security of continuity of supply in order that the supply should be cheap, and also would tolerate a greater voltage variation than was now allowed by the Commissioners. How did Mr. Turnbull get the cost of a pole line below £300 per mile? He, personally, knew of a line which had been approved by the Electricity Commissioners, the cost of which had been £120 per mile and he had mentioned one to Mr. Turnbull which cost £25 per mile, this low cost being possible by getting the farmers to provide the poles and labour for erecting the line, under the supervision of the electricity supply authority's staff, there being no better people for stringing an overhead line than farmers, owing to their experience in straining wire fences. This had been done in South Wales and it was common practice in America. In Sweden the usual

cost of a low-voltage line was about £100 per mile and in America, notwithstanding the higher cost of labour and material, it was usual to put up a 6,600-volt line for about £150 per mile. Where underground cables were necessary, there was a method of laying them cheaply in clay pipes by means of a machine which ploughed the soil, laid the pipe, and drew in the cable. The great point in rural electrification was to create the load; if electricity were offered at ¼d. per kWh to-day, the demand would not be very great; the public must be educated how to use electricity in every possible way. In France the development of large rural areas had been found to pay eventually, and in various Continental districts there was a consumption of 5,000 kWh per mile of road in such areas, which was a paying proposition, although naturally everybody would like to increase that figure in this country.

Lieut.-Col. W. A. Vignoles (Grimsby), owing to the cost of making new roads, anticipated that most building in rural areas would be along the existing main roads, and that the houses would be close together. In that event, instead of overhead lines, they would have to use underground cables because the former would be unsightly; probably they would have to have a high-voltage main along each main road with transformer stations at intervals. Moreover, there would be difficulties in running overhead lines owing to the existence of Post Office wires already. In a case at Scunthorpe and Frodingham the overhead wires were stretched from gable to gable of rows of villas and it was not at all a pleasing sight. He was not at all convinced of the view stated in the paper that underground mains cost more for maintenance than overhead lines, because from the small amount of experience he had had with overhead lines this did not appear to be the case. He also gathered from the paper that if they could have less stringent regulations, the cost of constructing overhead lines would be reduced, but he could not help noticing when he was on the Continent a year or two ago, where they were told that the regulations were easy, that they were putting up steel and concrete poles where timber poles could be had almost for the asking and were of no value at all. As a matter of fact, the standard of pole construction in certain parts of the Continent was extremely high. If they were to use that type of construction, the cost of maintenance would be very considerable.

Mr. R. A. Chattock (Birmingham) said the hesitation of municipalities to go into rural areas was justified because of the difficulty of showing a profit, but large municipalities could afford to take a little risk in the matter and wait until development was such that it became a paying proposition. Certainly, industrial centres were more fitted to develop the rural areas around them than anybody else, but he did not think the proper means of doing it was by what had been called a "grid iron" all over the country. They should be developed by thin lines radiating out from the big centres, because such an arrangement would enable electricity to be supplied most cheaply. No reference was made in the paper to supplies at low voltage for farmhouses and similar premises. Col. Crompton had been instituting a campaign in favour of 50 or even 30 volts and it seemed to him that, whilst the wiring could be reduced in cost very materially (because such a voltage could be dealt with by bare wires cleated up anyhow) the cost of getting the electricity to the farmhouse would be very materially increased owing to the need for a very big section of cable, and in the end there would not be much difference in the cost of the kWh. Whilst d.c. might not be suitable in rural areas, it was suitable in the residential portions of larger areas.

Councillor R. Dalton (Carlisle) said Carlisle had been considering this subject carefully for two or three years and now intended to apply for an extended area to embrace all the rural areas which touched Carlisle. The great difficulty was want of commercial enterprise on the part of Electricity Committees. The first question always asked was: "Will it pay"? but municipal electricity undertakings should be a little venturesome and take a little risk.

The Mayor of Aylesbury spoke on similar lines, and expressed the hope that the farming population would come forward in the Aylesbury and other areas and support what was being done in this direction.

Councillor A. E. Gough (Cardiff) said that although Cardiff was situated in the area of a power company, the Corporation had been successful in obtaining some fringe orders. His complaint with regard to them, however, was that they took too long to get through. It was not due to the Cardiff electrical engineer that supply was not being given in the outside areas, but to difficulties with some of the members of the Council who would not agree to anything that would not show an immediate profit.

Alderman Senington (Bristol) said Bristol had been making similar endeavours and, at the same time, suggested that it was not unreasonable to ask the outside areas, in certain circumstances, to pay a little higher price than that paid in the area of the supplying authority. The great point, however, was to get supplies of cheap electricity to the rural areas.

Mr. S. E. Britton, replying to the discussion, hoped Mr. Turnbull's cheap overhead lines would turn out to be economical, with low maintenance and reasonable continuity of supply. He, himself, had been more concerned with getting a really reliable supply and he was installing cables to meet the demands of the next few years. The very low figures that had been quoted seemed quite impossible, having regard to the figures he had before him of the cost of copper; for instance, taking three 0.1 sq. in. copper cables, copper at £70 per ton amounted to £400 per mile, which did not seem quite consistent with the figures that had been mentioned. The increased value of land when electricity suply was taken into a district was very important, and there were cases in the rural areas around Chester of farmers, who had bought land at £40 or £50 per acre for agricultural purposes, selling off the fringes at £250 per acre for building purposes. As to the cost of maintenance, the first overhead line put up by him 18 years ago, half a mile long, had not had £5 spent on it in repairs; a 6,000-volt line erected 6 years ago had not entailed the expenditure of £1, and a 33,000-volt line in use since 1921 had not had anything spent upon it except the cost of replacing three insulators. During the past three years he had put up between 50 and 60 miles of overhead lines and the cost of repairs had been between £3 and £4; the maintenance of overhead lines was not an expensive matter, and repairs could be carried out very quickly as compared with underground cables. He knew of Col. Crompton's campaign, but there was likely to be great danger in adopting such a policy because it would mean that householders would have to handle apparatus consuming a large current. For instance, at 30 volts a 500-watt electric iron would mean 10 amperes and a 3-kW radiator would mean 100 amperes; he considered the thing perfectly ridiculous and unworthy of consideration. The kWh consumed per member of household, taking different types of houses, varied from over 800 (in one case 999) to about 50, and it had been the general experience that immediately a power line was taken into the country development went on at a rapid pace and people from the outlying districts came into the town to see the showroom. The amount of money which people would thus spend upon electrical apparatus was surprising, and in a few years' time he confidently anticipated that users in the rural areas of Chester would be consuming more electricity per head than were the consumers inside the city. In connection with voltage variation, it was satisfactory to know that the Electricity Commissioners had sanctioned 8 per cent. for the Chester rural areas, as compared with the usual 4 per cent., whilst even in France the figure was 7 per cent.

Electric Battery Vehicles.

Their Operating Cost and Competition with Rival Types.

By C. W. Marshall.—*Abstract.*

Electric vehicles have been used in the transport services of the Glasgow Corporation Electricity Department since 1913, the experience gained in this period affording a sound base for estimating operating cost and the extent to which such vehicles can compete with rival types.

The actual types of vehicles in use range from a half-ton lorry to a ten-ton tractor, and machines of almost every available make have been tried. The working conditions have been very varied, ranging from light delivery work on good roads to refuse collection on routes with extremely bad surfaces.

The types of batteries which have been tried in Glasgow included thin- and thick-plate lead types from several makers, and nickel-iron batteries from three makers. The present position is that the lead battery is in favour, due in a great part to the fact that it is much cheaper in initial cost and at the same time gives service at least as good as that obtained from the alkaline battery. The relative merits of thin- and thick-plate lead batteries is still an open one, although the three years' guarantee now issued with the latter type has done a great deal to decide the matter in its favour. The thin-plate battery lasts only 12 to 15 months and costs about 60 per cent. of the price of the thick-plate battery, which lasts 30 to 36 months. It is, however, possible to get a much greater capacity for a given weight and volume with the thin-plate battery and so in some cases the vehicle becomes much more useful. For example, vehicles in the service of the Glasgow Corporation Cleansing Department which could only do one shift on refuse collection when fitted with thick-plate batteries can do two shifts with thin plates. When this is the case the extra cost of the battery is thoroughly justified.

It is of interest to note that an Italian firm uses extremely thin plates (.6 mm.) and gets extraordinarily high capacity per unit weight (approximately twice that obtained in a normal thin-plate battery, or two-and-a-half times that of a thick-plate battery). The life of such batteries is only about four months, but the originators of the system seem to think that the results obtained are quite satisfactory; the vehicles in this case are passenger omnibuses.

Alkaline batteries cost from two to four times as much as the best lead batteries. Although they last at least five or six years under hard service conditions, and eight or ten years under easier conditions, their low watt-hour efficiency and high internal resistance counteract the long life to some extent. There are, however, some conditions which are specially suited for alkaline batteries. The principal characteristics of the different types of batteries are summarised in Table I.

TABLE I.—Battery Data.

Type of battery.	Alkaline.	Lead (thin plate).	Lead (thick plate).
Watt-hour efficiency ...	59%	75%	75%
Watt-hours per cu. in. ...	0.74	0.8	0.6
Watt-hours per pound ...	15	12	9
Initial cost (approx.) £/kWh	30	4	8
Life in years	6-8	1	3
Life in cycles of charge and discharge	1,800/2,400	300	900

The operating costs have been calculated, and are illlustrated graphically in fig. 1, which shows the running cost per vehicle mile of electric lorries of 0.5 to 5-ton load capacities for varying annual mileages. To assist in reviewing the relative importance of the various items, they are arranged in descending order of magnitude in Table II for a 2-ton vehicle.

TABLE II.—ANNUAL OPERATING COSTS OF 2-TON ELECTRIC LORRY.

Item.	£	Per cent.
Driver's wages	150	34.5
Depreciation and interest ...	75	17.3
Battery renewals	34	15.9
Tires	26	7.9
Electrical energy	25	6.0
Licence	22	5.8
Garage	19	5.0
Maintenance	14	4.4
Insurance	—	3.2
Total	434	100.0

Cost of complete vehicle, £552.
Cost of battery, £208.
Cost of energy per kWh, 0.75d.

Driving a good electric vehicle is so easy that it may be considered correct policy to employ the cheapest type of labour. In the opinion of the writer it is much more satisfactory to employ a good class of men and to teach them to look after the machine in an intelligent way; if this is done, there is very little need of any other maintenance staff. The recent extension of the guarantees of lead batteries from two to three years marks an important step in the direction of reduced costs. The plain fact is, however, that users of electric vehicles must have some assurance that the supplies of batteries will be certain and that there is little danger of a serious increase in price. Tire cost is now among the primary cost items of all mechanical vehicles. The basic price of electrical energy used in these calculations is ¾d. per kW hour, but as the item represents only a small percentage of the total cost, it has very little effect on the general economic position. The electric vehicle has already been granted a concession when used by non-trading municipal departments; the annual tax under these conditions is only £6. In view of the very desirable characteristics of the "electric" from the standpoints of small road wear, this concession should be extended to all users. The electric vehicle has a great advantage in respect of maintenance, as the number of moving parts need not exceed 10 per cent. of those in a petrol vehicle.

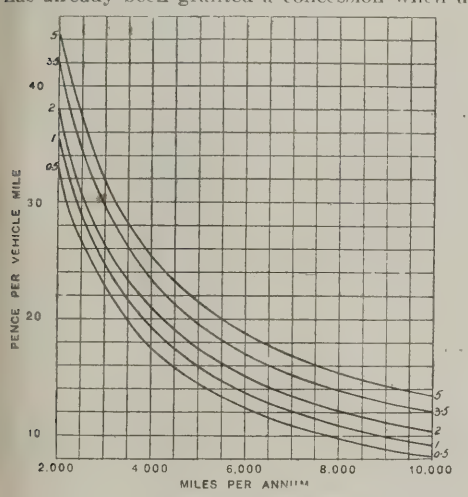

Fig. 1.—Total Cost per Vehicle Mile of Electric Lorries.

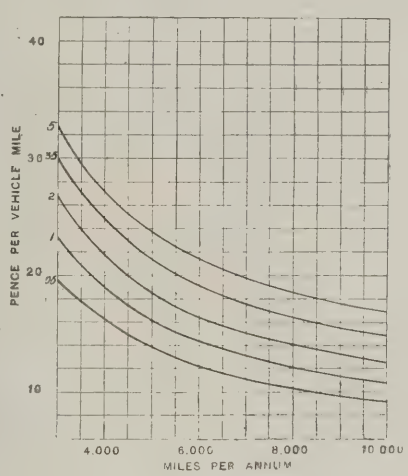

Fig. 2.—Total Cost per Vehicle Mile of Petrol Lorries.

Assuming that the available supply of electricity is at 440 volts, 3-phase, 50 cycles, the cost of battery-charging plant varies from £10 per kW at a capacity of 10 kW to £7 per kW at a capacity of 100 kW, these prices including converting plant, control gear on both the a.c. and d.c. sides, wiring, and erection. Taking 15 per cent. per annum to cover all charges on the plant, the cost is 0.124d. per kWh for the smaller and 0.087d. per kWh for the larger plant, the load factor being assumed to be 33 per cent. When, as is the case in Glasgow, vehicles which operate at night are kept in the same garage as those which operate by day, the load factor of the charging plant can easily reach 60 per cent., or more; the efficiency of the charging plant should not be less than 75 per cent. even with an output of 10 kW.

The battery vehicle should be confined to cases where the daily distances do not exceed 35 to 45 miles. The horse does not appear to be losing much ground as yet; the working cost of horse-drawn vehicles (Table V) are the lowest compatible with the use of good-class horses and vehicles

Analysis of the figures will show that the average rate of working of the horse does not exceed 0.5 kW, and that the energy expended per day is only about 4 kWh; the horse, therefore, compares very unfavourably with the battery in both power and energy capacity. The price paid for energy in this form is 9d. per kWh, taking only feeding charges into account, and if the whole of the charges directly connected with the horse are considered, the price of the kWh rises to about 1s. 6d. If the characteristics of the horse-drawn vehicle are considered to be desirable, it would be an easy matter to produce an electric vehicle which would reproduce these characteristics, but while everyone seems to be satisfied that a low-speed horse-drawn vehicle is all right, a mechanical vehicle is considered of no account if it cannot attain a speed of at least twelve miles per hour.

TABLE V.—ANNUAL OPERATING COSTS OF HORSE-DRAWN VEHICLE.

Item.	£ s. d.
1. Driver's wages	141 5 0
2. Feeding, bedding, and stableman's wages	52 10 0
3. Rent of stables	10 0 0
4. Horse depreciation	7 10 0
5. Repairs to vehicle	7 10 0
6. Insurance	7 10 0
7. Horse shoeing	6 5 0
8. Taxes	3 3 0
9. Saddler	1 17 0
10. Veterinary surgeon	1 5 0
Total	£238 15 0

Average daily cost	16s.
Average cost per vehicle mile ...	10.7d.
Average number of hours' work per day (six days per week) ...	8 hours.
Average speed	2.75 miles/hour.
Average mileage per day	14/18 miles.
Weight of load	25 cwt.
Weight of vehicle	12.5 cwt.
Weight of harness	98 lb.
Weight of horse	16 cwt.

It appears from Table VI (annual mileage=10,000) that the real competitors are the petrol and electric vehicles for mileages and loads of the order under consideration. The table shows that half-ton and one-ton "electrics" are respectively 15 and 5 per cent. more expensive to run than petrol vehicles, but that 2-, 3½-, and 5-ton "electrics" are cheaper than the corresponding sizes of petrol vehicles by 2, 7, and 15 per cent. It could, therefore, be argued that there is no room at all for light electric vehicles, but some British firms of high standing continue to build electric vehicles for light delivery work. The operating cost of petrol vehicles is further illustrated in fig. 2, which shows the cost per vehicle mile of ½-, 1-, 2-, 3½-, and 5-ton machines for annual mileages up to 10,000. The petrol vehicle is, of course, quite capable of distances up to 70,000 miles per annum; there are, however, many cases in which the mileage requirements are well within the capacity of the battery vehicle, and a concrete example of this kind is the German postal delivery system. The German Government has now in use 800 electric vehicles for postal deliveries, and the magnitude of this undertaking is so great that it is worthy of further description. Only two types of vehicle are used, and they are very similar in design; the load capacity is two tons, and a single motor drives the rear wheels through a differential countershaft and chains. Pneumatic tires are used; the batteries are of the thin-plate lead type, and each consists of 40 250-amp.-hour cells. The mileage per charge obtained regularly is 36 to 42 miles, but it is stated that it is not a rare occurrence to get 60 miles per charge. The battery life is 6,000 to 7,000 miles for positive plates and 12,000 to 18,000 miles for negative plates. It is said that the use of pneumatic tires reduces the energy consumption by from 10 to 15 per cent. on stone-paved roads, and by from 3 to 5 per cent. on asphalt roads, as compared with solid tires.

TABLE VI.—WEEKLY OPERATING COST OF PETROL, STEAM, AND ELECTRIC VEHICLES.

Load (tons).	Petrol.	Steam.	Electric.
0.5	117/-	—	137/-
1	146/-	—	153/-
2	176/-	—	173/-
3.5	212/-	249/-	198/-
5	246/-	275/-	224/-

There is hardly anything more reliable than a really good electric vehicle, and an engineer who purchases wisely will never be worried by vexatious reports of breakdowns. The jobs which an electric vehicle can do in connection with a large electricity department are very numerous, and there is usually work for lorries, vans and tractors. In the case of the Glasgow Corporation Electricity Department, the light lorries and vans are used in connection with the showroom, meter, and welfare departments, the heavier lorries and tractor on the mains department services, while the heaviest tipping lorries are used for the removal of ashes from the power stations. A well-operated fleet of machines is also a good advertising medium and cannot fail in the end to impress on other transport users that there is really something in electric vehicles.

Discussion.

Mr. A. NICHOLS MOORE (Newport, Mon.) said the author had done a good service in jogging the industry a little, because he believed there were many opportunities for useful service for the electric vehicle. It must, however, be kept to its right sphere. A good deal of trouble had been due to enthusiasts, in pushing the electric battery vehicle forward, advocating it for every possible kind of service, whereas it was quite clear that it was not suitable for many classes of service. At Newport he had had 6½ years' experience with electric vehicles for refuse collection and in some respects the figures he had obtained differed strangely from those in the paper. For instance, the energy costs were 0.0624d. per mile, as against 2d. in Newport for the 2-ton vehicle. It appeared that the author took 15 years as the life of the vehicle, which he did not consider at all reasonable. Apparently, too, a mileage of 10,000 per annum was taken as the basis, but that mileage was not obtained in practice; if from 3,000 to 4,000 miles per annum were run in practice, then they were doing very well. The cost of renewals in the paper rather agreed with his own figures, but he had depreciated his batteries on a three years' basis, although he managed to get 4½ years out of most of them. The cost of maintenance of the vehicle, apart from the batteries, had been very heavy indeed at Newport, and that had been due to faulty construction. The result was that he had scrapped the earlier vehicles and was using them as trailers behind the later ones. One of the reasons why the electric battery vehicle had not made greater progress was the direct opposition and antipathy of borough surveyors, and he said, without hesitation, that that was one of the greatest difficulties to be got over. At the same time, there was a great deal to be said for that opposition, based on experience of such vehicles for refuse collection. When used for the delivery of refuse at a tip such vehicles were hopeless owing to the rough handling they received; when used for delivery at a destructor they could be built with a low loading line and could be used under the most favourable circumstances. The fact was that in recent years the design of petrol vehicles had been considerably improved, whereas the manufacture of electric vehicles had stood still.

Mr. A. W. BLAKE (Willesden) had little fault to find with the figures in the paper as they confirmed his own experience. He urged supply station engineers to develop the use of the electric vehicle because the load of one vehicle was worth that of 10 cookers and was off the peak, while cookers were not always. His own policy had been to keep the men thoroughly interested in the vehicles and arrange to teach them how to look after every part of the vehicle. In that way, he had been able to create quite an intelligent interest and the men had been able to win a few prizes. As the result of thorough attention in the garage it had been possible last year to run 14 vehicles for 307 working days, and a great deal of overtime, with a loss of only 14½ hours' stoppage on the road. With regard to the life of 14 or 15 months mentioned in the paper for thin-plate batteries, he had found that by renewing the positive plates at the right time it was possible to get something like another year's life out of the batteries.

Councillor J. THICKETT (Walsall) urged a progressive policy on the part of supply station engineers as regards the use of electric vehicles, which were not advertised enough.

Mr. J. W. BEAUCHAMP (E.D.A.) said that if the electric vehicle had not some virtues it would have disappeared long ago. In spite of their neglect in developing it, there were 2,500 electric battery vehicles in this country in addition to a large number of platform trucks. It was necessary, however, to discriminate very carefully in handling the main electric-vehicle business for road transport and not endeavour to push it for unsuitable purposes. Endeavours should be made to push the vehicles, not in cases where only one vehicle would be required, but where a dozen or more were necessary. He had been very much impressed, from recent inquiries, by the fact that so few municipal electricity departments had any mechanical transport at all; it was time every supply department had mechanical transport, preferably electric, not only because of its practical use, but because of the advertisement offered. What was required was a very distinct and concentrated salesmanship effort.

Mr. A. H. SHAW (Ilford) said that in Ilford the first vehicle was started 11 years ago (a 4-ton wagon) and as the result of that experience it was found that a 4- or a 5-ton wagon for coal-carrying for the Electricity Department was very much cheaper than any other means of transport; that was short-distance heavy-haulage, for which purpose the electric vehicle would easily beat steam or petrol. He was glad to say that the Ilford Public Health Department had also taken up electric vehicles for house-refuse collection, whilst the Electricity Department had now a second vehicle for coal haulage. Last year he purchased a small tractor for hauling cable drums, but the registration authorities asked for a tax of £22 because they said it was not an electric vehicle, but a tractor. After considerable protest and much assistance from the Electric Vehicle Committee, a tool box was added and the vehicle was called a truck, with the result that the usual tax of £6 was imposed by the taxation authorities.

Mr. C. W. MARSHALL, replying to the discussion, said his figures were all taken from actual Glasgow experience; 10,000 miles a year was certainly a good annual mileage, but it was being obtained and anybody who would accept 3,000 miles was easily satisfied. Perhaps the reason why the maintenance was heavy at Newport was because they had some of the early vehicles which were badly constructed; he had had some of them himself. On the other hand, he had vehicles which had needed practically no repairs; they did from 25 to 35 miles a day and gave no trouble at all. The reason was that there were only 10 working parts in the whole of the vehicle. As to refuse collection, he had found it paid handsomely to use electric vehicles for delivering to tips. He agreed as to the value of educating the workmen in the care and maintenance of the vehicles and Birmingham was also doing work on the same lines. The renewing of the positive plate, as mentioned by Mr. Blake, did add to the life of the battery, but the output was reduced. Generally, he claimed, that it was the business of the station engineer to push the electric vehicle, and they should not blame the public health authorities for not adopting them if they were not pushed.

Alderman H. LEESE (Stoke-on-Trent), in proposing a vote of thanks to Mr. Marshall, said that at Stoke they paid the drivers of their electric vehicles about one-third more than was paid in Glasgow, and added that as the result of using electric vehicles it had been possible to halve the cost of getting coal from the sidings to the works.

Mr. W. C. P. TAPPER (Stepney), who seconded, expressed the hope that the suggestion in the paper that an electric vehicle should be constructed to correspond with the horse vehicle so far as speed was concerned, would not be acted upon by manufacturers because they wanted to rid the streets of slow-moving traffic.

The I.M.E.A. Exhibition.

(*Continued from page* 932.)

Messrs. ELECTROLUX, LTD., displayed and demonstrated the "Electrolux" household refrigerator, model "D," and cooling unit (ELECTRICAL REVIEW, February 26th, 1926, p. 327). This model has a white-enamelled finish and is designed as a handsome piece of kitchen furniture. The walls contain 3 in. of cork insulation and are lined on the inside with washable white enamel. Well-spaced glass shelves provide accommodation for a large amount of food.

Messrs. SADIA ELECTRICAL APPARATUS exhibited several types of electric storage water heaters of from 2-gallon capacity upwards. The special feature of the stand was the new 2-gallon type of water heater, fig. 7. This boiler, which combines all

Fig. 7.—Electric Storage Water Heater.

the special advantages of the larger Sadia apparatus, has the additional advantage of being compact and of small dimensions, and is therefore suitable for use over wash-hand basins and sinks in flats and small houses. Some new designs of electric quick-heating plates were also shown. These were of the enclosed type and mark a new departure in this apparatus, combining efficiency with speed in operation.

An interesting selection of storage geysers were displayed on the stand of the BASTIAN METER CO., LTD., including some arranged over both a suitably-arranged bath and sink. It is interesting to note that "Bastian" geysers are now hired or hire-purchased to their consumers by more than 20 different municipal undertakings in England alone. The "Imperator" stove, some models of which were also shown, is designed to replace the steam radiator. Three new "Imperator" 1-kW fires and a number of pigmy heaters for table use added to the interest of the exhibit, while a feature was the "Little Wonder" grill ovens, which were fitted with "Bastian" quartzalite elements. Various types of these elements were included in the large number of articles on the stand. A few electric steam boilers were also included in the exhibits. These were of the fire-tube type and fitted with "Quartzalite" elements, which, it is claimed, can be taken out and replaced while the boiler is actually under steam. This type of apparatus is claimed to have an efficiency of 98 per cent. A feature of it is that it will produce superheated steam up to 500 deg. F. at a pressure of only 5 lb. per sq. in. "Bastalite," a product of the company, is of some interest. It is a preparation which is painted on the bottom of the kettle, to improve the efficiency of absorption, and which, it is claimed, will not wash off.

As might be expected, the feature of the exhibit by Messrs. BERRY'S ELECTRIC, LTD., was a display of the "Magicoal" electric fire, which imitates a blazing coal fire, introducing flickering flame effect. Several new models were shown, of which the following is a selection:—The "Newberry" fire is designed on new and novel lines with overhead heating, which incorporates a new patented 2-kW circular heating bar. The heating efficiency of this apparatus is claimed to be particularly high. The "Fyglo" model has been produced to meet the requirements of hiring schemes, particular attention having been paid to the cheap renewal of element wires. A good fire effect is obtained without the use of a lamp. A new design of the "Mulparvo" model is being introduced. This is built on similar lines to that of the existing fire of the same name, but it is improved greatly in appearance and has a loading of 2 kW with three-heat control, against 1 kW on the old model. Other examples of fires shown included some of the dog-grate type of period designs. Extreme care has been taken with a view to economy in the cost of production of these hitherto expensive models, which has resulted in considerable reductions in some of the very attractive fires.

Fig. 8.—The B.T.-H. Stand.

A large stand occupied by the HOTPOINT ELECTRIC APPLIANCE CO., LTD. ("Hotpoint-Falco") occupied the whole of one side of the Main Hall. The feature of the exhibit was a representative display of electric cooking apparatus, including heavy cooking appliances for hotels, restaurants, and ships. The heavier appliances consisted of pastry and baking ovens, roasting ovens, boiling pans and fish fryers. In the last mentioned, three different methods of heating were shown, radiation, conduction (clamp-type elements), and direct heating by induced currents (ELECTRICAL REVIEW, April 2nd, p. 561). The domestic cookers were in sizes for from two to three people, such as the No. 3,252 bungalow model, increasing up to the double-oven range for 25 to 30 people, which is suitable for small restaurants and large private houses; baking plates, wash boilers, and grills were also included in the display. A few cookers were in actual service, demonstrations being continually carried out, and these included the following novel features in the boiling plate elements:—A new standard semi-enclosed boiling plate, a plate with "Globar" elements, and a new solid-type plate. The electroducer cooking was also demonstrated.

The JACKSON ELECTRIC STOVE CO., LTD., showed some improvements which have been incorporated in its existing models of cookers. These included a new type of grill with easily-removable elements on the lines of the maker's No. 84 boiling plate. This grill can be arranged with 3-heat regulation. A cooker with side and bottom elements was shown by request, and a stainless-metal hob fitted to one of the cookers was an item of interest. A feature of the exhibit was a new type of electric kettle fitted with an automatic cut-out. No fusible plugs or replacement parts are needed to put the kettle in operation again after the cut-out has been in action, the connection being remade by the consumer. The contact is a positive make-and-break switch, and this apparatus should prove of interest to those dealing with hiring schemes.

A particularly pleasing and informative exhibit was shown by the E.L.M.A. LIGHTING SERVICE BUREAU, the arrangements of which were largely carried out by the Scottish Section under the direction of Mr. H. E. Hughes, the district engineer. An ingenious lamp display cabinet, illustrating the wide range of standard electric lamps, was a feature of the stand. Each lamp could be switched on, and at the same time the number of hours' burning per kWh was indicated on a luminous sign. This was particularly appreciated by the public. In addition to standard gasfilled lamps, there was a display of daylight, white, and coloured-sprayed lamps. Home-lighting cubicles were included in the display to represent the different aspects of home lighting and to contrast the effects that could be obtained by modern methods of lighting with those of bad design. To represent the vast progress in electrical illumination during recent years, special demonstration cabinets were included in the stand equipment. These were in four series each. The cabinets represented home, loom, factory, and colliery lighting. In each case the lighting equipment, whether modern or old, was illustrated by appropriate backgrounds. To emphasise the value of shop lighting and to illustrate how maximum efficiency could be obtained by electric lighting in properly-conceived reflectors and glare entirely eliminated, model shop windows were featured. These were designed so that a shopkeeper could actually experiment for himself and be thoroughly convinced of the efficiency of modern shop-window lighting equipment. A well-produced booklet, "Lighting Service," which was issued by the Bureau in connection with the Exhibition, outlines the work of that body, and shows the necessity for good lighting in all directions.

The Glasgow Corporation Electricity Department had a splendid display. Chamberlain & Hookham special prepayment two-part meters, a minimum power-factor meter, and a demand indicator with a self-contained synchronous motor were prominent and attracted much notice. Visitors interested in housing paid considerable attention to the "Selfix" electric installations; by using the special materials supplied with a "Selfix" outfit it is claimed to be possible for any man to put in a complete electric-light installation which will meet the requirements of the Institution of Electrical Engineers. The Corporation also showed cookers and fires, British-made vacuum cleaners, Venner time switches, a British Resistor hot-plate, fire, and furnace, and Wilkinson thermostats. The fittings on the stand were by Osler & Faraday.

Messrs. SMITH & PAGET, LTD., had an interesting display of electric washing and mangling apparatus.

The MOCLARY, CANADA, company showed some excellent designs of electric cooking apparatus.

The Electrical Association for Women had an attractive stand, displaying pamphlets, &c., while the British Electrical Development Association (Inc.) also displayed leaflets relating to their work.

In addition to the new "Cosmos" electric boiling plate, described fully in our last issue, MESSRS. METRO-VICK SUPPLIES, LTD., exhibited several new types of electrical domestic appliances, some new internally frosted lamps, a selection of chromium-plated Harcourt fittings, and a new type of lampholder, the "Emvee," which is designed with solid plungers and has a large current-carrying capacity. A Brighton street lantern was also shown.

A variety of domestic apparatus was shown by Messrs. L. G. HAWKINS & Co., LTD., and the "Universal" cookers occupied a large portion of the stand. A "Kelvinator" refrigerator was also on show, and also a whole line of "Universal" coffee percolators, irons, kettles, toasters, some "Miller" fittings and a selection of "Ivanhoe" glassware. The "Junior" model "Vio-ray" high-frequency apparatus also proved interesting. The high-frequency coil of this apparatus is of special design, which prevents, it is claimed, any sparking back or risks of breakdowns. The kicking coil and break are assembled in a "Bakelite" container, and the high-frequency coil is assembled in a high-grade ebonite handle.

Included in the exhibits of the GENERAL ELECTRIC CO., LTD., which we referred to in our last issue, was a new design of "Magnet" electric suction cleaner. The feature of this device is that the nozzle brush is so designed to straighten out any loose threads on the surface to be cleaned ready for absorption, and simultaneously to press back the pile of the carpet, so that the suction may withdraw the dust and grit from the weave and knots of the pile, and even from the underside of the carpet. It is claimed that the brush does not become choked and dirty as in the case of the ordinary broom, because the constant suction of the cleaner swallows every particle of dirt and grit over which the cleaner passes; the suction is applied evenly across the nozzle. This is designed to facilitate cleaning under low furniture. A swivel-type rear wheel enables easy operation in any direction; all the wheels are rubber-tired and leave no track, it is claimed, in the rug or carpet. The control switch is at the extreme end of the handle and a stop locks the handle in a horizontal position for the cleaning of stairways and difficult objects. The bag is composed of a strong material of fine texture, and is fitted with an aluminium airtight coupling. The lubricating system is automatic, the oil being injected through two spring-closed ball oilers and passed into small reservoirs, from which it is conveyed to the bearings by wick and spring devices. All the accessories are easily and instantly adjustable.

Fig. 8 is a view of the B.T.-H. stand to which we referred in our last issue. *(To be concluded.)*

An Electric Light-ship.—The *Royal Sovereign*, a light-ship stationed seven miles off Eastbourne, at present an oil burner, is to be fitted with a powerful electric light.

Exports and Imports of Electrical Goods and Machinery in May, 1926.

In the appended table giving details of our foreign electrical trade during May, the export comparisons both with April, 1926, and the preceding May need qualification, as neither shows the true position. In the first place April was a bad month and the decline of £40,878 is really a further fall from an already low figure. On the other hand, the decline of £550,135 in comparison with May, 1925, is not so serious as it looks, as the violently-fluctuating item, "submarine cables," accounted for £373,351 of the fall. In the face of the general strike, there were several notable increases, of which that in the traction motor section was the most marked.

The imports were seriously affected, having been reduced by a third from the April total, although the difference between the May totals for the two years was not quite so great.

The re-exports were less than half the April value, and only a third of the May, 1925, total.

Further reference to the statistics is made in our "leader" pages.

The Electricity (Supply) Bill.

The Proceedings in Committee.

(*Continued from page* 938.)

The appeal tribunal to be set up under Clause 4 was discussed when Standing Committee "C" of the House of Commons resumed consideration of the Electricity (Supply) Bill on June 14th. Sir R. Sanders presided.

Mr. R. Hudson (Gateshead, U.) moved the insertion of the following proviso at the end of Clause 4, which deals with the duty of the Board to prepare and carry out the scheme:—"Provided that if any authorised undertakers on whom obligations are imposed by the scheme consider that the carrying out of those obligations would be prejudicial to them, they may, within one month after the publication of the scheme as adopted, by notice in writing, specifying the nature of the complaint and of the relief sought by them, require the Board to refer the matter complained of to the arbitration of a barrister (or in Scotland an advocate) of not less than ten years' standing appointed by the Minister of Transport, and the Board shall refer the matter accordingly, unless they amend the scheme by relieving the complainants of such obligations as aforesaid, and shall not, pending the determination of the complaint, carry the scheme into effect so far as it affects the complainants.

"(4) The arbitrator to whom any such matter is so referred may, if satisfied as to the justice of the complaint, either order such pecuniary compensation to be made to the complainants as seems equitable in all the circumstances or order the scheme to be amended in such manner as he may direct.

"Provided that the arbitrator shall not grant any relief other than pecuniary compensation in any case where the Board certify that the grant of such relief would conflict with the basic principles of the scheme or would prejudicially affect the efficiency of the scheme." Mr. Hudson explained that his proposal, which had been very largely discussed in advance, was merely an attempt to set up an appeal tribunal on the lines of the compromise which he had suggested earlier in the discussions.

Sir J. Nall (Manchester, Hulme, U.) moved to amend the amendment by leaving out the words "on whom obligations are imposed by the scheme," and to insert in their place the words "or any local authority or other body or person." It was essential, he said, that all those who might be legitimately concerned, should have an opportunity of stating their case to the tribunal. Mr. Hudson's amendment provided that authorised undertakers on whom obligations were imposed might appeal to a barrister to be appointed by the Minister, and the barrister, on such appeal, could not alter the scheme if the Board, which was one of the parties to the Bill, certified that such alteration would conflict with the principles of the scheme, or affect its efficiency, and the barrister could only order compensation to be paid to that authorised undertaker. That seemed to be rather a one-sided arrangement and would largely nullify the value of an appeal. The amendment which he (Sir J. Nall) was proposing would ensure that the very narrow limit of authorities on whom obligations were imposed should not be the full scope of the appeal tribunal.

Col. Ashley, Minister of Transport, thought it would be unwise to accept Sir J. Nall's amendment, which was then defeated by 28 votes to 16.

Sir J. Nall moved a further amendment to the amendment to leave out the words "carrying out of those obligations," and to insert instead the words "provisions of the scheme." Schemes of the kind indicated would contain provisions which did not involve the carrying out of obligations, and, in effect, Mr. Hudson's amendment was so drawn that not only would the parties who could come to the tribunal in the first instance be severely restricted, but the points on which they could appeal would be equally restricted if the words proposed to be deleted were left in.

Sir D. HOGG resisted the amendment, which was ultimately withdrawn.

Sir J. NALL moved to leave out the words " arbitration of a barrister (or in Scotland an advocate) of not less than 10 years' standing appointed by the Minister of Transport " in order to insert the words " tribunal of appeal by this Act constituted," because he intended later to move an amendment for a definite and permanent appeal tribunal, to consist of five members, who should be appointed for a term of five years by the Lord Chancellor.

The amendment was under discussion when the Committee adjourned.

On resuming on June 15th, Sir D. HOGG said that the Government would not object, later on, if the tribunal proposed in Mr. Hudson's amendment were utilised for other clauses and for other appeals which might come at a later stage of the Bill. The qualification of a barrister of not less than ten years' standing was the highest form of legal qualification that could be imposed. The Government, in accepting Mr. Hudson's amendment, was trying to meet the desire to give an appeal to some impartial lawyer. He could not accept Sir J. Nall's amendment.

Mr. G. BALFOUR (Hampstead, U.) wished to make the strongest possible protest against the proposed appeal tribunal. There was to be one arbitrator, with the power to say that rights which had been granted in perpetuity could be repealed on the *ipse dixit* of one man, without any appeal to Parliament.

Mr. ATTLEE (Limehouse, Lab.) suggested that there might be a panel of barristers from whom the chairman of the appeal tribunal should be selected.

Sir J. NALL'S amendment was then negatived by 35 votes to 12.

Mr. ELLIS (Wakefield, U.) moved to leave out the words " of not less than ten years' standing appointed by the Minister of Transport," in order to insert " qualified for appointment to high judicial office appointed by the Ministry of Transport from panels set up by the Lord Chancellor, or, in Scotland, the President of the Court of Session, respectively, for that purpose."

The amendment was accepted by the Government and agreed to.

Mr. LOOKER (Essex, S.E., U.) moved an amendment to permit the arbitrator, in any case in which he thought it expedient to do so, to call in the aid of one or more qualified assessors and to hear the case wholly or partially with the assistance of such assessors. The amendment was agreed to.

Sir J. NALL then moved to leave out the words :—" Provided that the arbitrator shall not grant any relief other than pecuniary compensation in any case where the Board certify that the grant of such relief would conflict with the basic principles of the scheme or would prejudicially affect the efficiency of the scheme." His object was to ensure that any monetary compensation ordered to be paid to the appellant by the tribunal should come out of the guaranteed fund; it was necessary to ensure that the cost of giving compensation should not fall on the industry.

The amendment was negatived.

On the question that Mr. Hudson's amendment, as amended, be added to the Bill, Sir J. NALL protested against what he termed a travesty of the tribunal which Sir D. Hogg had agreed to accept. The Board was left, for all practical purposes, the unfettered arbiter in its own house, able to override the statutory rights of municipalities, of great corporations, of county councils and urban and rural authorities, who would have no redress of any kind unless they came within the very narrow limits of the amendment, and, to secure redress, they must prove some financial loss. That was an entirely novel departure from the ordinary procedure of Parliamentary control of legislation, and was even a departure from the Act of 1919.

Mr. G. BALFOUR also protested against the tribunal, and urged that the Board should be made answerable to Parliament.

Mr. Hudson's amendment, as amended, was agreed to and added to the Bill.

An amendment, moved by Sir J. Nall, to add at the end of the clause the words :—" Provided that a generating station included in a scheme as a selected station shall not cease to be a selected station without the consent of the owners thereof," was accepted by Sir D. Hogg and agreed to.

Clause 4, as amended, was then agreed to, and the Committee adjourned.

On June 17th, consideration was given to Clause 5, which sets forth the procedure to be adopted by the Board for dealing with existing selected stations.

Sir F. HALL (Dulwich, U.) moved an amendment to provide that, with regard to the scheme, the owners of selected stations should be consulted in all cases in order that there should be no material alterations in schemes that had already been put into operation. In view of the money that had been spent on generating stations the owners should know exactly what was to happen.

Lt.-Col. MOORE-BRABAZON, the Parliamentary Secretary to the Ministry of Transport, said that Sir F. Hall was really trying to re-open a question which had already been decided.

Mr. G. BALFOUR pressed for an outline of the scheme. The Committee had not the slightest information to guide it as to what was the intention of the Government in setting up these selected stations.

Sir C. WILSON (Leeds, Central, U.) declared that the profits made by certain existing concerns were, under the Bill, to be confiscated in order that certain areas might benefit. The scheme was, apparently, to be a second " Post Office scheme," but even the General Post Office was careful not to take over any concern or interest that did not pay. The whole of the people of Leeds, and all the Chambers of Commerce, were against this scheme, which he would do his utmost to expose on every possible occasion.

Sir G. HUME (Greenwich, U.) said he would be very disturbed if the Government had to prepare a scheme. Under the Bill it had been decided that the preparation of the scheme should be left in the hands of the Electricity Commissioners, who were highly competent to deal with these matters. He hoped the Government would be very careful not to put any scheme forward.

The amendment was negatived.

Sir J. NALL moved an amendment to provide that, where alterations or extensions to selected stations were required by the Board, they should be made under the scheme or under an amending scheme. Under the amendment, he said, the owners would be protected against unreasonable requirements in regard to large capital expenditure by having the right of appeal to the arbitrators appointed under Clause 4. The Board, under the Bill, could require the owners to undertake such extensions and alterations as it might think fit without having any opportunity of repeal or redress.

Sir D. HOGG accepted the amendment, which was agreed to.

Sir J. NALL then moved a further amendment to provide that large additional alterations or extensions should be dealt with under an amending scheme, and that the owners of the stations affected should have the right of appeal to the arbitrators.

Lt.-Col. MOORE-BRABAZON contended that Sir J. Nall was endeavouring to start *de novo*.

Mr. G. BALFOUR protested against the final decision in a matter of this sort being left in the hands of a " bureaucratic Department." Alterations might be made involving £1,000,000 or £1,500,000, and they, he thought, ought certainly to come under an amending scheme with the right of appeal.

The amendment was negatived.

Sir D. HOGG next moved an amendment to ensure that the additional extensions and alterations which the Board might direct to be undertaken must be approved by the Electricity Commissioners before being put into operation. He explained that under the Clause as it at present stood there was to be an appeal by the owners to the Electricity Commissioners and a further appeal to the Railway and Canal Commission, but it was now desired to have one appeal tribunal throughout the Bill and the Government had agreed to that principle, and would provide for that in a later amendment. That procedure would involve there being no real safeguard, apart from the Board's own decision, on technical matters, which would raise a difficulty under the 1919 Act (Section 11) under which the consent of the Electricity Commissioners was required for any extension. It would be ludicrous if the Board directed that extensions and alterations were to be carried out, and then the Commissioners would not give their consent to them. To prevent that difficulty the amendment would provide that the Board should only direct additional extensions or alterations if they were approved by the Electricity Commissioners.

The amendment was agreed to.

Sir D. HOGG then moved to leave out that portion of subsection 1 of Clause 5, which provided that in the event of the Board's directing, with the Commissioners' approval, the carrying out of additional extensions or alterations which might be unreasonable, there should be the right of appeal to the Electricity Commissioners and then to the Railway and Canal Commission, and to insert instead the words " impose upon them an unreasonable financial burden, the matter shall, if they so require, be referred to the arbitration of a barrister (or in Scotland an advocate) appointed by the Minister of Transport from the appropriate panel set up under section 4 of this Act, and the arbitrator may in any case in which he thinks it expedient to do so call in the aid of one or more qualified assessors and hear the case wholly or partially with the assistance of such assessors." He said that as the Clause had been amended, there would be an appeal to the Electricity Commissioners from the Commissioners' decision, which would be impossible. Therefore, the Government had decided that the tribunal established under Clause 4 should hear appeals against unreasonable financial burdens, and his amendment would provide for this.

The amendment was agreed to. The Committee has thus decided that, under the Clause, the appeal by owners of " selected stations " on technical matters should be to the Electricity Commissioners, and, on financial matters, to the arbitration tribunal set up under Clause 4.

Sub-section 2 of the Clause provides that if the owners of any selected stations are unwilling to " carry out such arrangements to the satisfaction of the Board, the Board shall be entitled to acquire the generating station at a price to be determined in accordance with the provisions of the First Schedule to this Act. . . . ."

Sir J. NALL moved an amendment to leave out the words " Board shall be entitled," and to insert the words " Minister of Transport may by order empower any authorised undertaker or any other company or persons approved by the Board or failing such authorised undertakers, company, or persons, the Board." The amendment was accepted by Sir D. Hogg, and carried by 35 votes to 12.

Sir J. MARRIOTT (York, U.) moved to provide that before any generating station could be acquired by the Board, the Board must apply to the Minister of Transport for an order to do so, and then the matter must be referred to the Appeal

Tribunal to consider the substance of the complaint made by the Board in respect of the alleged default of the owners, and the Minister shall not have the power to make the order until the appeal has been heard. He maintained that the Board ought not to have the drastic power of breaking up a statutory authority until a full inquiry had been held.

Sir D. Hogg, however, pointed out that Sir J. Marriott's complaint had been met by the previous amendment which he had accepted. Sir J. Marriott therefore withdrew his amendment, but moved that "any such Order shall be provisional only and shall not have effect unless and until confirmed by Parliament."

Col. W. Ashley considered that the setting-up of the appeal tribunal rendered this Parliamentary safeguard, which would involve considerable expense and delay, unnecessary.

Mr. Hannon (Moseley, U.), in supporting the amendment, felt that to allow a body outside Parliament compulsorily to acquire private property protected by Statute, was an innovation which should be very carefully considered.

Sir D. Hogg considered that there was already sufficient safeguard, but eventually moved an amendment to provide that an order authorising the acquisition of a generating station should not come into force until it had been laid before the House of Commons and the House of Lords for a period of thirty days, and that if either House objected the order should not be proceeded with.

Sir J. Marriott's amendment was then negatived, and the amendment of Sir D. Hogg was agreed to.

Major Attlee moved an amendment to the effect that where a generating station was acquired by the Board, the Board should either operate it itself or make arrangements with an authorised undertaker who should be a local authority instead of 'a company or person.'" The Labour Party, he said, stood for public control in electricity.

Sir D. Hogg resisted the amendment, which was negatived.

Major Attlee next moved to provide that if the Board were to acquire a generating station in the area of a Joint Electricity Authority the Board should first endeavour to arrange with the Joint Authority to operate the station.

Sir D. Hogg accepted the amendment, which was opposed by some of the Government supporters. It was eventually carried by 25 votes to 13.

Clause 5, as amended, was then carried by 22 votes to 7, and the Committee adjourned.

(To be continued.)

Two Small Automatic Generating Plants.

We have received some particulars of the electrical installations at two very old and historically interesting buildings, Dunvegan Castle and Kingsburgh, both on the Isle of Skye, which have been comparatively recently wired for electric light and power and equipped with generating plant. Dunvegan (fig. 1) is the oldest inhabited castle in Scotland, dating back to the 12th century, and has been in the possession of the Clan McLeod for 700 years, the present owner being the MacLeod of MacLeod. There are about 180 lights in the castle and an interesting feature is that in several instances the original ancient lamps have been adapted for electric lighting. The dungeons, which could tell many harrowing tales of prisoners who languished and died in them, now have lost most of their terror, for they too are electrically lighted. The generating plant consists of two 1,500-W, 110-V Kohler automatic generating sets arranged for parallel working. Each set consists of a 4-cylinder petrol engine directly coupled to a compound-wound dynamo. The engine is started and stopped by means of an automatic switch mounted over the dynamo. This switch is fitted with three main relays which, when the first load is switched on, are energised from a small 24-V starting battery which supplies the necessary ignition current for starting the engine and also drives the generator as a motor up to about 50 r.p.m., at which speed the engine starts firing and the controlling relays are de-energised.

Fig. 1.—Dunvegan Castle.

A safety switch-tripping device is incorporated in the automatic switch, which, if for any reason, say, want of petrol, the engine does not start within one minute, throws the switch out.

A similar automatic device is installed for paralleling the machines. When only one machine is running, this equipment carries the main current, and when full load is reached, relays are energised in a similar manner and the second set is run up and put on load with the first. When the load decreases, the reverse action takes place. A d.p. change-over switch is fitted to the paralleling device, by means of which either machine may be put on circuit first. The operation of running up the first machine and also of paralleling in the second, is only a matter of few seconds.

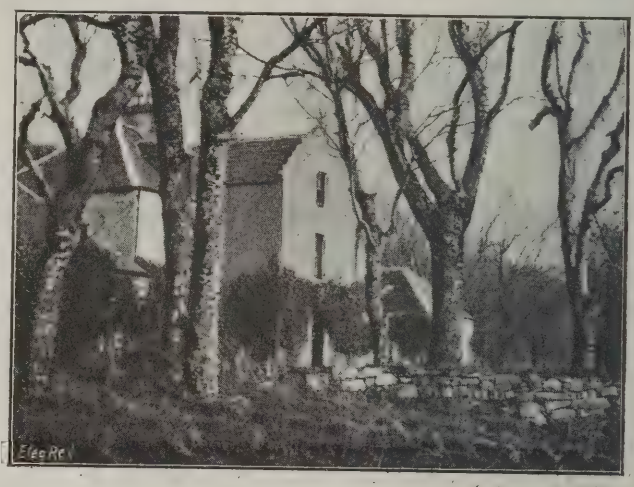

Fig. 2.—Kingsburgh.

Kingsburgh (fig. 2) is famous as the house in which there lived that great lady whose name will for ever be romantically associated with her bravery in conducting the pursued Bonnie Prince "Charlie" to Skye, *viz.* Flora Macdonald. Here there are 65 lights in the installation and the energy is supplied by one Kohler automatic set similar to those installed at Dunvegan Castle. This has been in uninterrupted use for 2½ years.

Both of these historic buildings were wired on the Henley wiring system, and the entire electrical work for both installations was carried out by Messrs. Lowdon Bros. & Co., of Dundee, to whom, and to Messrs. W. T. Henley's Telegraph Works Co., Ltd., we are indebted for the above particulars and the photographs.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Vertical Gravity Coal Dryers.

A very simple form of coal dryer and preheater is being marketed by Messrs. Fuel Engineering, Ltd., Parliament Mansions, Victoria Street, London. The "F.E." dryer, fig. 1, consists of vertical hollow louvred columns or walls, headed by suitable hoppers, the size and number of the columns depending on the character and quantity of the material to be dealt with. Waste gases from the boiler or furnace flue are utilised and are drawn through the walls con-

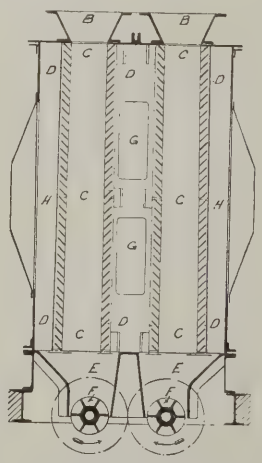

Fig. 1.—Vertical Coal Dryer.

taining the coal, the louvres forming the necessary inlet and outlet. Facilities are provided for controlling the temperature at which the drying is effected; and the rate of travel of the coal through the columns can be varied to suit the conditions and the character of the coal. the device for this control being the only mechanism employed. The dryers can be constructed in single units with capacities of from 1 to 25 tons per hour.

A Solder Compound.

Another solder compound, "Zippo," for use without the aid of fluxes, acids or other cleaning agents, has recently been introduced by MESSRS. ENGINEERING TOOLS, LTD., 11B, Upper Thames Street, E.C.4. This material is produced primarily for use with aluminium and other non-ferrous metals and alloys. We have used "Zippo" and obtained a good joint, and while we would not hesitate to recommend its use where strength is required we would point out the necessity of following closely the instructions issued for working with it. Rather a higher temperature is required for "Zippo" than for ordinary solder. It is made in two grades, medium and hard, the latter being necessary for only exceptional cases. The results of tests carried out on joints made with this new material at the University College, London, show a tensile strength of 3.79 tons per sq. in. for a medium "Zippo" joint, 0.35 in. by 0.34 in.; also a strength of 6.35 tons per sq. in. for a hard "Zippo" joint of 0.32 in. by 0.345 in. The material is made in bars to suit the trade or the domestic user; it has a fusing point of 280 deg. C., and it is claimed to have a heat conductivity equal to that of copper, and that it is unaffected by atmospheric conditions.

A Light Electric Car.

Notwithstanding the ever-increasing popularity of petrol-driven vehicles, it is interesting to learn that the SOCIETE DES APPLICATIONS ELECTRO-MECANIQUES, of 148, Avenue du Roule, Neuilly-sur-Seine, France, has recently introduced a little two-seater car known as the "Electrocyclette" which weighs only 5 cwt., complete with a battery of 10 cells, and is capable of allowing a distance of about 30 miles to be run on one charge at a speed up to 12½ m.p.h. The frame of the chassis is constructed of armoured ash, and suspended fore and aft on semi-cantilever springs. The compound electric motor is rated at 3-4 h.p.; it is located at the rear of the vehicle and drives the rear axle through bevel gearing, the accumulators having a capacity of 250 amp.-hours at 28 volts. A three-position hand

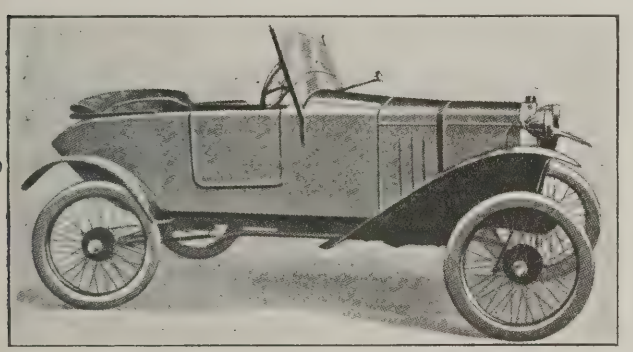

Fig. 2.—The "Electrocyclette" Two-seater Car.

lever (forward, reverse and brake) is provided, while intermediary speeds are controlled by an accelerator pedal; there is also a pedal actuating a brake on the rear wheels. The cost of running is negligible and for those requiring a simple vehicle for conveying them between their residence and place of business, within a distance of 15 miles, or for short out-and-home runs of not more than 30 miles, the makers claim that the "Electrocyclette," fig. 2, is an ideal vehicle. When alternating current only is available for charging the battery a simple rectifying device can be fitted permanently on the car. The vehicle has a wheelbase of 6 ft. 4in. and a track of 3 ft. 3 in., 500 by 50 mm. pneumatic tyres being fitted to the wire road wheels. The Company is also making a single-seated vehicle suitable for the use of invalids. This is fitted with a 150 amp.-hour battery of eight cells, of a capacity for about 20 miles on one charge.

Spiral Rolled-Steel Transmission Poles.

What promises to be of considerable interest to transmission-pole users is a new type of pole, of spiral rolled steel, fig. 3, embodying a new method of construction, which is being made by the BRITISH ROLLED STEEL POLE CO., LTD., 110, Cannon Street, London, E.C.4. These poles are constructed under the Kershaw Walker patents from rolled steel strip. This strip, which varies in thickness from 1/16th in. upwards, in passing through the rolling mill, has impressed on its surface a raised projection, or rib, parallel to the edge longitudinally, and the strip is spirally coiled upon itself with its edge lying close up to, and directly under, the rib, which serves as an interlocking device, and prevents any collapse or vertical or horizontal depression of the pole. It is claimed that the rib adds greatly to the strength and rigidity of the structure, which is further stiffened by the spiral or helical convolutions being hermetically sealed to the body of the pole. The poles are claimed to be remarkably light, rendering them suitable for transport over long distances, and immune from the attacks of insect borers; thus they are suitable for tropical and sub-tropical countries. They are made in lengths varying from 16 to 30 feet, having a diameter of 2¼ in. at the small end and 4 to 6 in. at the base. Longer poles are made of heavier steel.

The spirally-wound poles taper very gracefully, are elegant in appearance, and they can be painted, galvanised, or otherwise protected both inside and outside. Cast iron, concrete

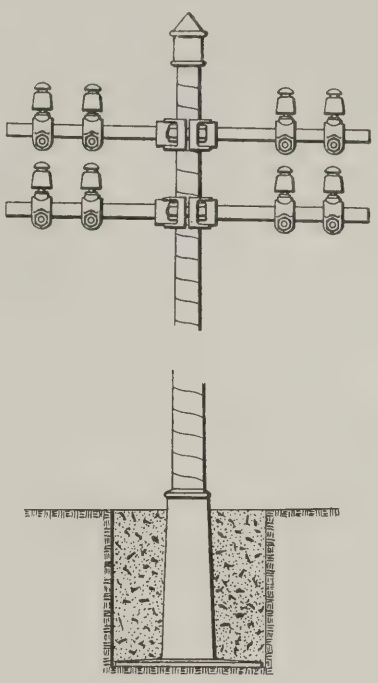

Fig. 3.—Spiral Rolled-steel Pole.

or other shields of various designs to guard the lower ends of the poles from corrosion at the ground line can be supplied with the poles where required.

The weight of the pole varies from 54 and 101 lb. (16 and 30 ft.) in the case of the light steel strip, to 67 and 126 lb. and 88 and 164 lb. for No. 14 and 12 gauge steel respectively.

The Finance of Electricity Supply.

Municipal Accountants' Conference.

AT the annual conference of the Institute of Municipal Treasurers and Accountants, held at Southport last week, a paper was read by Sir Harry Haward on the "Finance of Electricity Supply Undertakings in Great Britain."

At the outset the speaker explained that having regard to his official position as an Electricity Commissioner it was not his intention to raise matters of a controversial nature, but to give a paper which was informative rather than critical. After briefly sketching the development of electricity supply, public control, and the raising of capital, reference was made to capital expenditure, and in making the statement that expenditure on main transmission lines by private companies had been £4,259,241, as against £3,966,441 by local authorities, Sir Harry explained that the reason for this was because the heading "companies" included a number of large power companies. He stated that there was very little "watered capital," and that although a rather large figure was shown in the table which he had prepared under the heading of "Public Authorities—Miscellaneous," he explained that this included the unallocated cost of purchasing certain undertakings, notably the St. Marylebone Corporation's expensive purchase of a London company. The speaker's remarks dealing with working capital were the subject of considerable criticism in the subsequent discussion. The speaker said that under existing legislation a local authority was allowed to borrow for the purpose of providing temporarily for any current expenses, on the condition that the amount borrowed should be repaid out of the revenue received in respect of the financial year in which the expenses were incurred. Several speakers strongly resented this method of dealing with the matter, and it was said that one of the greatest weaknesses of public undertakings was the serious overdrafts. Temporary borrowing only scratched the surface of the matter, and permanent capital was required for working expenses. Mr. J. H. McCall, of Croydon, protested vigorously on this point, and pointed out that public authorities might be in the peculiar position of having invested reserves on one side of the balance sheet and an overdraft on the other. Sir Harry Haward subsequently reminded the speaker, however,

that reserves must of necessity be invested in securities, and could not be utilised for working capital or invested in wasting assets.

The remuneration of capital was dealt with at some length, together with the repayment of loans and depreciation, reserve funds, purchase options, and the allocation of profits, and in the last connection the following statement was received with obvious goodwill. "Further, there is force in the plea that as the local rate is mortgaged for all moneys borrowed for the purposes of the electricity undertaking and is liable for any deficiency thereon, the ratepayers are entitled, if they so desire, to some benefit in return for the risk involved and the advantage which the consumers obtain by the pledging of the municipal credit. So long as the sum taken in relief of rates does not cause the prices of electricity to be raised above ordinary commercial rates the consumers have no just cause for complaint."

Referring to average price obtained, Sir Harry said that the companies received very much more for lighting and domestic purposes, but in the aggregate the amounts received were much the same as those received by the municipalities. The speaker's final remarks dealt with joint electricity authorities and the proposed Central Electricity Board, emphasis being laid on the fact that "it is not contemplated that the Board will ordinarily acquire or construct generating stations or carry on extensions of stations, but that this work will be undertaken and financed as now by the existing undertakers."

In the course of the discussion Mr. ARTHUR COLLINS pointed out the necessity for local authorities to inquire into the terms granted to old customers. There were often ways in which agreements made at the very outset of the undertaking could be revised, and investigation would prove whether this was possible or not. He urged that local authorities dependent for supplies upon private companies should see that their interests and rights were "subject to oversight." Reconsideration should periodically be given to any recurrent purchase options, and the borough treasurer should submit a report on the accounts to the finance committee. The new Bill, he feared, would establish a rival borrowing authority.

Alderman A. J. BLANCHARD (Sheffield) said that he was voicing the views of many authorities when he said that he wished that the Bill only dealt with transmission. In any case, he maintained that local authorities, such as his own, where prices lower than the average were charged, should be left alone. Sheffield was already supplying at a lower price than the Government expected to be able to attain 16 years hence. Further, they had allocated no less than £70,000 to relief of rates. Under the present proposals they would, in any case, be losers to the extent of the capital raised out of revenue. This view was also expressed by Mr. E. J. JOHNSON, O.B.E. (West Ham).

Councillor COTTRELL (West Bromwich) amused the audience by asking the speaker if he could guarantee that West Bromwich would obtain lower charges by entering into an agreement with the West Midlands Authority. They were told that the surrounding district would benefit, but what he wanted to know was whether their local manufacturers would suffer. Sir Harry, in replying, said that whilst, naturally, he could give no guarantee, he could say that the scheme as outlined showed every likelihood of proving cheaper for town as well as country. The number of questions asked and the obvious desire of the members of the Institute Council to know more of the financial provisions of the Bill prompted the speaker to arrange a further meeting with the executive during the period of the Conference.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Electrical Literature.

Previous mention has been made in the "Correspondence" columns of the ELECTRICAL REVIEW of the vast number of books now published dealing with the design and construction of various classes of electrical apparatus and machinery. Several books of this type are indeed excellent works, but there is one point which I find is very often overlooked, and, in my opinion, it is a point well worthy of consideration.

I venture to suggest that if a few chapters were devoted to a discussion on some of the many practical methods that are at present applied inside workshops in connection with the manufacture of electrical apparatus and machinery, such chapters, apart from being very interesting, would prove to be distinctly helpful.

A book dealing with the design of electric motors might be considered as an example: much may be written regarding the electrical and mechanical design and general construction, but a "chat" on the methods of manufacture as adopted in many foundries, armature winding shops, assembly and testing departments, &c., would tend to the production of a more comprehensive work, for it is possible for one to concentrate very thoroughly on the design of an electric motor and to overlook certain difficulties that might occur in manufacture.

H. Breckell.

Swinton, *June 15th*, 1926.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

Swindon Corporation Bill.—As briefly mentioned in our last issue, this Bill came before the Unopposed Bills Committee of the House of Commons on June 11th, and was ordered to be reported for third reading. The Swindon Corporation already has powers to wire premises on the condition that the work is done through contractors. The opposition on the part of the contractors to the present Bill was in respect of Clause 51, which proposes to relieve the Corporation of the obligation to employ contractors to wire consumers' premises. It is understood that the question was discussed between the Incorporated Municipal Electrical Association and the Electrical Contractors' Association, and that an agreement was come to with the result that the Bill became unopposed by reason of the insertion of the following provisos in Clause 51:—(*a*) That the Corporation should not sell electrical installations and apparatus except at retail prices; (*b*) That it should not sell any such apparatus to the trade save where there was an electrical contractor of whom the consumer or prospective consumer was a customer or prospective customer, in which case it should sell to the contractor at trade price; (*c*) That if such retail and trade prices were agreed, they should be determined by a committee representative of the interests concerned appointed by the Electricity Commissioners on application; (*d*) That the Corporation should so far as practicable adjust the prices and the charges made for materials provided and work done to meet any expenditure incurred in connection therewith (including interest and sinking fund for repayment of moneys borrowed); and (*e*) That the total sums received and expended by the Corporation should be separately shown in the published accounts.

Bristol Corporation Bill.—The Local Legislation Committee of the House of Commons began the consideration of this Bill on June 9th. One of the objects of the Bill relates to the building of a new power station at Portishead, and Mr. TYLDESLEY JONES, K.C., who appeared for the Corporation, explained that the present power station had reached the limit of its capacity, owing to the lack of condensing water. Consequently the Corporation had decided to build a new power station on land which would allow of the installation ultimately, if necessary, of plant having a capacity of 240,000 kW. It was possible for the Corporation to build the station, with the consent of the Electricity Commissioners, without going to Parliament, but it was the custom to obtain legal powers in order to prevent a public utility authority from being sued for nuisance. A local inquiry had been held by the Electricity Commissioners and among those who sought permission to oppose was the West Gloucestershire Power Co., but it was decided that the Power Co. whose boundaries were some miles away from the boundaries of the area of supply of the Bristol Corporation, had no *locus standi*. When the present Bill was deposited in Parliament the Power Co. lodged a petition and the Corporation objected, but the Court of Referees of the House of Commons had decided that the Power Co. should be heard against the Bill. The case of the Power Co. was that the erection of a new power station by the Bristol Corporation would interfere with the development of its business, although it was impossible to understand how this could be the case. At the present moment the Power Co. had an area of 300 square miles and was making application for additions to that of 590 square miles; at present it had one power station for this huge area containing 10,000 kW and capable of extension to 30,000 kW. Obviously that station could not meet the needs of such an important area as the Power Co. possessed.

Evidence in support of Counsel's statement was given by Mr. H. FARADAY PROCTOR (chief electrical engineer, Bristol).

Before the conclusion of the Corporation's case, it was announced by Mr. CRAIG HENDERSON, K.C. (for the Power Co.), that the company would not continue its opposition. The Corporation intended the station for its own needs, and, in so far as it was a station capable of expansion, the company would leave it to the Electricity Commissioners to decide what the future was to be.

The Committee allowed the clause, and considered that the site was most suitable for the erection of a generating station.

Private Bills.—The Royal Assent has been given to the Ayrshire Electricity Order Confirmation Bill, and to the Ascot Gas and Electricity Bill. The Kidderminster and Stourport Tramways Bill has been read a second time in the House of Commons. The London Electric and Metropolitan District Railway Companies' Bill was read a third time in the House of Commons on June 21st.

Telephone Development.—On June 15th, Sir W. MITCHELL-THOMSON, Postmaster-General, informed Captain Fraser that in the year ended March 31st last, 222,494 telephones were installed. During April, orders were obtained at the rate of over 5,300 per week and at the end of that month, omitting those orders for which subscribers were not then ready for service, there were in hand 13,600 orders, representing less than three weeks' work. At the same date, some 800 applications for service were outstanding which could not be met pending the completion of certain engineering works. Telephone publicity work was carried out by a canvassing staff of about 400 and by the exhibition of posters, the distribution of leaflets and booklets through the post, from Post Office counters and through the agency of canvassers. The wages and commission paid to the canvassing staff in the year 1925-26 amounted to about £136,000, but part of this sum was chargeable to other duties which the staff performed.

Special Orders.—The following Special Electricity Orders have been approved:—Bedford (Extension), East Anglian, Petersfield and District, Wrexham Rural District, and Millom.

Radio Music in Parks.—On June 16th, Col. DAY asked the Under-Secretary of State for the Home Department, as representing the First Commissioner of Works, whether it was proposed to introduce wireless concerts in London parks as a substitute for bands.

Captain HACKING said he could only answer for the Royal Parks. It was not proposed to introduce radio concerts as a substitute for bands in any of those parks.

Cutting off Electric Light.—On June 17th, Sir EVELYN CECIL asked the Home Secretary whether, in the case of an offence against Section 22 of the Electric Lighting Act, 1882, by unlawfully or maliciously cutting or injuring any electric line or work with intent to cut off any supply of electricity, which was punishable as felony and liable to penal servitude or imprisonment, the Home Office took the initiative in prosecuting or, if not, what procedure was adopted.

Sir W. JOYNSON-HICKS said that the normal course, in that as in any other case of felony, would be for the police to take the necessary action on receiving information that an offence had been committed.

Shropshire, &c., Bill.—On June 17th, the Shropshire, Worcestershire and Staffordshire Electric Power Co. Bill came before the Unopposed Bill Committee of the House of Lords, which ordered it to be reported, with amendments, for third reading.

Legal.

Francis Polden & Co., Ltd., v. Murless.

IN the Mayor's and City of London Court, on June 16th, before Judge Shewell Cooper, Messrs. Francis Polden & Co., Ltd., electrical contractors, brought an action against Mr. R. A. Murless, of Waltham St. Lawrence, Berks., for £44 12s., for work done in dismantling a "Delco" electric lighting plant, fitting new parts and re-erecting it. Mr. PAUL, for the plaintiffs, said that the defendant obtained the plant in a bad condition from America, and asked the plaintiffs to re-condition it, and fit his premises throughout with electric lighting. The total value of the contract was about £300. The work was finished in April, and everything was found to be satisfactory. Later the engine broke down, and it was found that the breaking of a split pin had allowed a nut to get loose. The machine was again repaired and put in running order, and the sum claimed represented the cost of new parts and labour expended. The defendant had refused to pay on the ground that when the plaintiffs accepted his original order there was a guarantee that if any breakdown occurred through faulty material or workmanship within six months it would be made good by the plaintiffs. The plaintiffs contended that the breakdown was not due to any fault of theirs. When they were first shown the engine they called in an expert and provided such new parts as, in his opinion, were necessary. With the machine that came from America was the split pin which had been the cause of the trouble, and in the view of the Delco expert it was in a satisfactory condition to be used again. Plaintiffs therefore contended that there was no negligence on their part.

For the defence Mr. KINGHAM submitted that the plaintiffs had not fulfilled their duty in replacing in the apparatus a split pin which it had been admitted had already been used and bent about.

Judge SHEWELL COOPER said that in his view the plaintiffs were bound under the contract to replace any parts of the engine which were defective, but he came to the conclusion that there was no negligence on the part of the plaintiffs' servant in re-fitting the split pin. Under the contract plaintiffs guaranteed not to supply faulty material, and that could only refer to material which they did supply. He gave judgment for the plaintiffs for the amount claimed, with costs.

Theft of Electricity.

AT the Llandilo Police Court on June 17th, John Edwards, a mineral water manufacturer, was charged with feloniously and fraudulently abstracting electricity belonging to the Llandilo Urban Council. Evidence was given showing that the defendant rearranged the wiring of a meter so that the electricity did not pass through the instrument. Defendant pleaded guilty and was fined £50 and costs.

A Welding Arbitration Case.

THE *Western Mail* reports that a Divisional Court, composed of Justices Salter and Fraser, recently heard an application made on behalf of the Cardiff Electric and Oxy-Acetylene Welding Co., Ltd. Mr. Joshua Davies (instructed by Messrs. Capron & Co., agents for Mr. Wilfred Rees, Cardiff) appeared for the applicants; Mr. Wilfred Lewis and Mr. Banks (instructed by Messrs. Higman & Randall) appeared for Alloy Welding Processes, Ltd.

Mr. DAVIES explained that in February of this year Professor Low held an arbitration with reference to a counterclaim by the Cardiff company against Alloy Welding Processes, Ltd., claiming damages in respect of an alleged defective portable welding plant sold to it by the plaintiffs. On February 16th Professor Low published his award, giving the Cardiff Welding Co. £227 damages in respect of its counterclaim. Counsel asked that the award should be remitted on the ground that there was ambiguity with reference to the costs. Mr. Wilfred Lewis argued that there was no ambiguity. The Court granted the application, and remitted the award to Professor Low.

Telephone Official Charged.

AT the Southampton Police Court on June 8th, Arthur J. Squire was sent for trial at the Hampshire Assizes upon a charge of embezzling £35 14s., the moneys of the General Post Office. It was alleged that the amount was collected from telephone subscribers in payment of their accounts.

Theft of Cable.

AT the Edinburgh Sheriff Court on June 14th, David Robertson and James Anderson were charged with the theft of 118 ft. of lead-covered cable belonging to the Edinburgh Corporation. The prosecution stated that the lads burned the cable to separate the lead from the copper and later sold the copper, which was valued at £3, for 8s. 6d. The prisoners were fined £2 each, or in default of payment 20 days' imprisonment.

Conspiracy Charge.

AT Leicester City Police Court, on June 18th, the hearing was resumed on charges of conspiracy against Charles Cohen, merchant, Dalston, and Leonard Louis Weiner, tailor's apprentice, London, E., who were accused of obtaining quantities of goods by means of forged references. Among the witnesses was Mr. W. Mills, secretary of Messrs. E. Brook, Ltd., electrical engineers, Empress Works, Huddersfield, who stated that Weiner & Co., of Leicester, wrote for quotations and afterwards ordered electrical machinery. References were asked for and given, and Messrs. Brook wrote to "Douglas Armstrong & Co.," and "Wm. Courtney & Co.," both of London, who replied stating that they had had dealings with Weiner & Co. and had found them quite satisfactory, being good for credit up to £500 per month. Messrs. Brook thereupon despatched to Weiner & Co. electrical machinery to the value of £38 and £29, for which they had never received payment. Evidence was given by Ralph Barcon, Highbury, N., formerly trading as Courtney & Co., that he had no knowledge of the reference produced, and had never signed such a document. His firm had no agents in Paris, Dresden and Cologne, as stated on the notepaper. The accused were remanded for a week, Cohen being refused bail, and Weiner being granted bail in the sum of £250, which was forthcoming.

Reviews.

Dictionary of Costing. By R. J. H. RYALL, F.C.W.A., with a foreword by Sir George Beharrell, D.S.O. Pp. xiii + 377. London: Sir Isaac Pitman & Sons, Ltd. Price 10s. 6d. net.

If the author had consulted the Oxford Dictionary, he might have chosen a different title for his book.

"The author's aim has been to produce a work which shall take its place as the standard book of reference in the costing profession." Truly, a huge task for one man to undertake, especially when he himself admits that vast strides have been made in the science of costing during the past few years. We are surprised, therefore, in handling the book for the first time, that it contains less than 400 pages of clear type. Surely this does not cover the whole ground of costing, as we should expect a standard book of reference to do. Again, are not vast strides still being made? We are fearful lest this standard book should very shortly suffer from obsolescence. However, here is a definite attempt to do what has been so obviously needed in the past few years; to collect data from all industries and from the practice of many cost accountants; and it should, at least for the present, give a fair indication of standard practice in the application of costing.

We are inclined to think that the authorship approaches editorship in this case, as there seem to be traces of many hands having made their contribution to the definitions and descriptions included. Naturally, such a book is received with hopeful, yet fearful anticipations, and one must confess that in the treatment of most of the subjects there is a thoroughness and a lucidity which make the book very readable, despite its encyclopædic form.

That the book is up to date is illustrated by the fact that there is described in it the "Paramount Sorting System," which seems to be destined to have a drastic influence upon the costing methods in vogue in many firms which cannot afford the more expensive machinery made for the same purpose.

The Institute of Cost and Works Accountants in 1923 issued a paper upon "Standardisation in Cost Accountancy," which constituted an authoritative pronouncement upon costing terminology, and we are frankly surprised that the author, a member, and a prominent member, of that body, should see fit to set up in some degree a new terminology of his own. Admittedly it is only in a very few terms that he goes astray, such as the use of "Factory Expense" instead of "Manu-

facturing Expense," and it may seem rather a quibble to suggest that this is a vital error, but if this is meant to take the place of the paper quoted, as a more comprehensive survey, it appears to us that a rigid adherence to the prime authority is most necessary.

The book is profusely illustrated with forms, tables and formulæ, which are very clear, and will repay the close study of cost accountants, engineers, and students. Nevertheless, it must be pointed out that such a book is bound to cover far more ground than is required in a small business, employing up to, say, 500 men. This is given in warning rather than condemnation, for, as far as the bigger firms are concerned, we can recommend it as a book of reference, subject to the qualifications already stated. No doubt, as times and customs change, the author will see to it that revised (and, we expect, enlarged) editions will be forthcoming.

This is not a text-book. It is a book of reference, and therefore certain subjects are not treated so exhaustively as they would have been in a text-book, or in a more specialised treatise; but the amount of ground covered is far more than has been covered in any book on costing published in this country. Used in conjunction with such text-books as can be relied upon, its value will easily be appreciated.

The last paragraph of the preface is arresting. If this book will do anything to wake up the vast majority of our manufacturers, who so sublimely think that their own antiquated, home-made, expensive, and inefficient methods bear some resemblance to sound systems or even justify the expense incurred in their upkeep, it will have been supremely " worth while."

Loud Speakers : Their Construction, Performance and Maintenance. By C. M. R. BALBI, A.M.I.E.E., A.C.G.I. Pp. xv+96; figs. 57. London : Sir Isaac Pitman & Sons, Ltd. Price 3s. 6d. net.

There is a considerable amount of scattered literature in the form of lecture reports and magazine articles on the subject of loud speakers, but singularly little has appeared so far in a comprehensive form.

This is all the more surprising as it has been recognised for some time that telephone reception for broadcast listeners will soon be confined almost wholly to crystal sets, and Mr. Balbi's little book would for this reason alone be sure of a warm welcome. But it deserves a welcome for other reasons as well, for it is accurate, concise, up-to-date, and as comprehensive as its size permits. The contents include short descriptions of the principles on which every loud speaker of note is constructed, how loud speakers are tested, and what points should be considered when purchasing one; and, in addition, there is a chapter on public address systems. A good summary is given of the outstanding practical characteristics of the various types of loud speakers on the market and the size of the room for which each particular type is suited.

The author sets out to give " an outline of our present-day knowledge in regard to loud speakers in all its branches," and he succeeds admirably, but we must remember that it is essentially an outline, and must not expect any deep delving into a subject which has so many interesting and little-understood depths. In fact the only criticism of the book we offer is that we should have liked more of it.

This little book should prove of considerable practical value to radio manufacturers, traders, and amateur experimenters.

Pyrometers. By EZER GRIFFITHS, D.Sc. Pp. xi+126; figs. 49. London : Sir Isaac Pitman & Sons, Ltd. Price, 7s. 6d. net.

The author of this work gives an account of the most recent developments in temperature-measuring appliances, and deals with the methods of testing and calibrating such apparatus. It is assumed that the reader has made himself familiar with the details of standard apparatus, either by actual experience with these, or by the perusal of makers' catalogue matter. The descriptive portions of the book accordingly deal with special problems in temperature measurement rather than with the most usual apparatus, at any rate, as far as electrical pyrometers are concerned. The portions of the book dealing with the calibration of pyrometers are both interesting and useful.

The opening chapter deals with the important matter of the establishment of a scale of temperature covering the range of industrial requirements. The problem of practically realising the basic thermodynamic scale has been no easy one. The constant volume hydrogen thermometer gives an exceedingly close approximation to the theoretical scale between 0 deg. and 100 deg., whilst the platinum-resistance thermometer scale gives sufficient exactness between the freezing point of mercury and the boiling point of sulphur when standardised at 0 deg. and 100 deg. A number of fixed points ranging from the boiling point of oxygen and the melting point of copper have been established with considerable precision. The calibration of expansion thermometers is dealt with in the second chapter, and the methods of comparison with standards between the limits −80 deg. and 450 deg., are described in detail. There is an interesting account of the problem of measuring surface temperatures. Thermo-electric pyrometers are amply treated and good information is given of the various combinations available for different circumstances. A good description is here given of the recording potentiometer type of thermo-electric instrument. The chapter dealing with resistance thermometers describes the application of this method to the measurement of the temperature of electric cables and of transformer windings. Various types of the disappearing filament optical pyrometer are described, and the theory of this instrument is briefly summarised. A short chapter on the total radiation instrument and an account of some typical electric furnaces for recent investigation work conclude the book.

A useful feature of the work is the reference made to standard text books for the benefit of readers desiring to acquaint themselves with the elementary theory of the instruments described. There is also a list of references to advanced text books and to original papers for those wishing to pursue the subject beyond the limits of the present work. Dr. Griffiths's book will be useful to those requiring a good general account of the present state of the science of temperature measurement, and also to electrical power engineers who have instruments for this purpose under their control.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

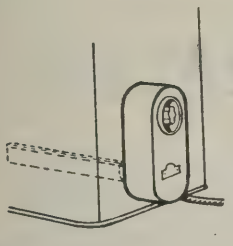
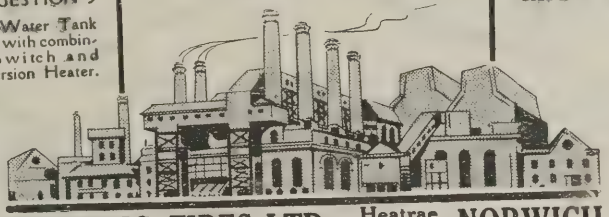
Heatrae



IMMERSION HEATERS

SUGGESTION 1
Heatrae Immersion Heater fixed in existing Hot Water Tank.

SUGGESTION 2
Heatrae Immersion Heater fixed in Steam or Water Heated Hot Closet. (If insufficient depth in Water Chamber at bottom a small auxiliary chamber can be added as shown.)



SUGGESTION 3
Hot Water Tank fitted with combined Switch and Immersion Heater.

M.G.P.

Made in various sizes and Types.

Three Suggestions for Increasing Summer Business

There is unquestionably a big field open to enterprising Traders introducing Immersion Heaters for alternative use with existing Hot Water Installations — *particularly now when adequate coal supplies are difficult to obtain.*

With the present coal limitations on Householders— surely here is *the* time to press home the advantages and economy of Electricity!

the finest insulating varnish in the world.

STANDARD CLEAR BAKING VOLTALAC (LA) (SV/11/BC)

AFTER many months of testing various grades of Insulating Varnish supplied by all the leading makers in the laboratory of a big electrical firm, Standard Clear Baking Voltalac (LA) (SV/11/BC) won easily on merit, for whereas many firms have produced a clear Insulating Baking Varnish with low acid figures, this had only been done at the sacrifice of elasticity, oil proofing, and drying qualities, all of which protective qualities are retained in the Standard Varnish.

ESTABLISHED IN PUBLIC SERVICE

The above illustration shows a battery installed at the Corporation Electricity Works, Dickinson Street, Manchester. It consists of 210 cells, giving 3 340 Kilowatts for one hour.

THE Houses of Parliament were designed in 1836. For ninety years there have met within men holding all possible views upon the subject of how the public is best to be served.

For thirty years likewise it has been the aim of Tudor Accumulators to give the public the best possible service.

No material or workmanship goes into a Tudor Accumulator that is not of a very high order. This standard we have endeavoured to maintain for thirty years.

That is why Tudor Accumulators are to-day Established in Public Service.

May we assist you in your especial battery problem?

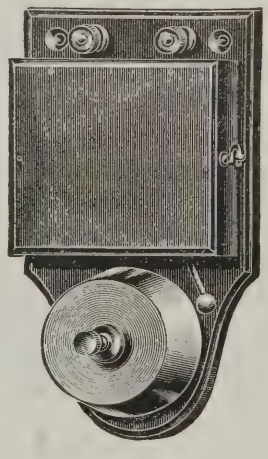
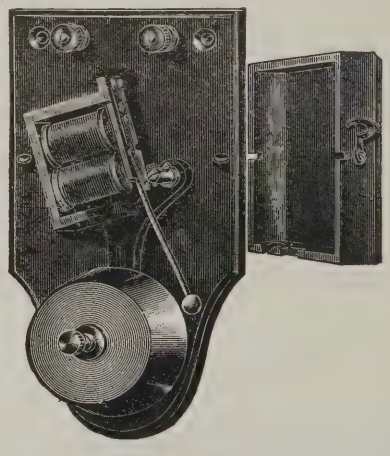
The illustration shows a Superior Quality Pendulum Indicator in polished hardwood case. Movements mounted on iron frames giving an efficient magnetic circuit. Pendulums swing on knife edges. Bobbins wound with best enamelled wire, Glass or Metal Screen, Flags numbered. Standard Quality Pendulum Indicators at competitive prices are also available, together with Mechanical Replacement and Lift Indicators. Immediate delivery can be given.

ROSETTES AND PEAR PUSHES



Well finished Rosettes with brass terminal plates and screws. Bore mounts. Pear Pushes fitted with German Silver springs and Silver contacts. Metal thread screws, Ivorine plunger and mount. Available in Real Cocus or Lignum Vitæ, Real Walnut or White Enamelled.



SUNCO ELECTRIC BELLS.

A comprehensive range of Electric Bells and Bell material covering every possible need is described and illustrated in the new Sunco Bell Catalogue (List No. 438). All types of Bells are covered, including Wood and Metal Case, Ironclad and Weatherproof Types.

Here is a further opportunity for increasing your business locally. Sunco Bells and Bell Material are in increased demand at this time of the year and it will pay you to have a supply in stock.

Write now for a copy of List No. 438, the supply is limited.

Ref. No. B102.

HEAVY TEAK CASE BELLS.

Highly polished, grooved, solid Teak Case, brass screwed cover, heavy brass turned terminals and eyelets. Strong cast iron frame, Platinoid contact points, large bobbins wound with silk covered copper wire. Resistance 4 to 5 ohms. Nickel plated round cast bell-metal gong. Available in 3 in. to 6 in. Round Gong and 3 in. Sheep Gong.

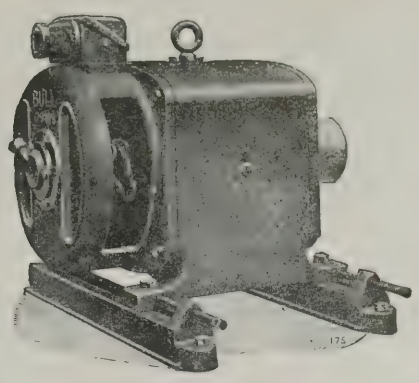
De Laval

Centrifugal Oil Purifiers

maintain the insulating properties of your Transformer & Switch Oils. They stand between you and a breakdown.

Protect your Transformers and H.T. Switchgear with a De Laval Centrifugal Oil Purifier.

RESULTS OF EXPERIENCE.



The dielectric strength of a transformer oil recently treated with a De Laval Type 700 Purifier, at the rate of 800 gallons per hour, was found to be over 50,000 volts (B.E.S.A. standard spark gap).

If all moisture, sludge, fibres, etc., are regularly eliminated from your insulating oils you eliminate risk of breakdown.

OVER 10,000 DE LAVALS ARE IN DAILY USE.

QUALITY & EFFICIENCY

"BULL" Machines are manufactured only from the highest quality materials by skilled workmen, and with the latest and most up-to-date design the highest efficiencies are obtained.

This means a big saving over a period when compared with cheaper quality materials and correspondingly lower efficiencies.

Consider this saving in cost in the long run when buying Motors, and remember

"BULL" MACHINES GIVE

CONTINUOUS TROUBLE-FREE SERVICE.

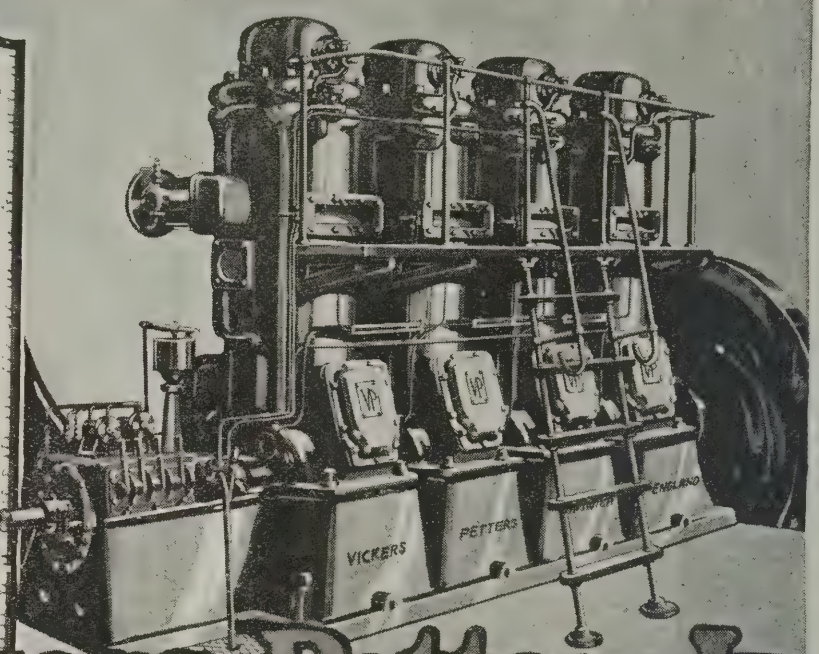
NEW V.P. MODEL

TWO-STROKE CYCLE
HEAVY-OIL
ENGINES

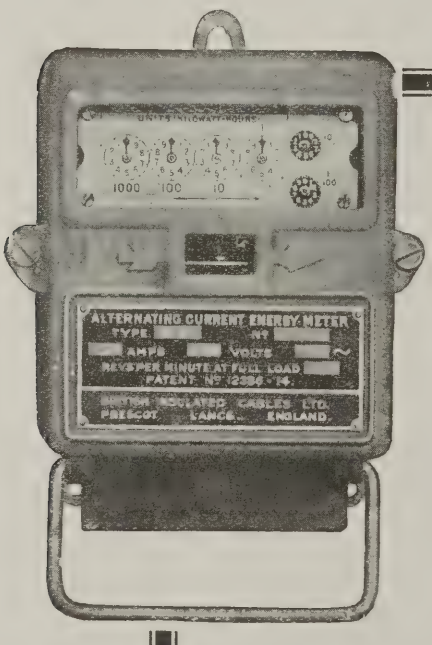
The Outcome of Thirty Years' Experience in Oil Engine Design and Manufacture.



TWO-STROKE CYCLE IS BEST.

The important advantages of the V.P. New Model "O" Type Heavy-Oil Engine with Completely Cooled Valveless Combustion Chamber are:—

NO VALVES in the heat of combustion chamber. LOW PRESSURES, LOW TEMPERATURES, LOW FUEL and LUBRICATING OIL CONSUMPTION. MINIMUM UPKEEP and ATTENDANCE. An Impulse per Rev. per Cylinder.



Made in Sizes from 1½ to 2,000 B.H.P. (B.E.S.A. Ratings) Industrial and Marine

OVER 375,000 B.H.P. IN USE.

High Efficiency Brings Lower Power Costs

Reduced Cost—Long Life—Strength

Efficiency should be the first consideration when comparing quotations for electric motors.

A few shillings difference in first cost cannot be considered if the motor does not excel in efficiency.

Our Motors, in addition to being highly efficient, are also low in price.

ASK US FOR PROOF.

Electrified Nursery Rhymes

No. 2.

There are sufficient outstanding features in Ferguson - Pailin Switchgear to justify "making a song about it."

Sound engineering design, economy in floor space, the damp and vermin-proof features and unique operating facilities all combine to maintain and extend the confidence and popularity enjoyed by this gear.

Our top illustration shows type HVD Duplicate Busbars electrically operated Unit in the operating position.

We invite you to read our latest brochure, "Metalclad Switchgear— Its Advantages and Characteristics," a copy of which will be sent on request, and which deals with the choice of switchgear from an engineering and scientific standpoint.

The following is a list of the chapter headings in this new brochure:—

1. The Evolution of Switchgear.
2. The Electrical and Mechanical Advantages of Metalclad Switchgear.
3. Distinctive Features of Ferguson - Pailin Design.
4. General Description of Gear.
5. Types of Units with current and voltage ratings.
6. Outlines of Various Units.

Write for your copy to-day.

Sold to and by the Trade

Sold to and by the Trade

PACKED & DELIVERED FREE.

DELIVERY FROM STOCK BY RETURN.

THE NEW FAN WITH THE ELLIPTICAL TRAVERSING MOVEMENT.
"THE BREEZE IS HERE, THERE, AND EVERYWHERE."

As the blades revolve there is a double oscillating movement, part horizontal and part vertical, so that the circuit of oscillation forms an ellipse, consequently the fanning range is greater than that of any other fan.

The Body and Guard of the Fan is highly finished in Black Enamel with Gold Lines, the Blades being finished imitation Gilt and Lacquered.

The low current consumption of 45 watts makes the "ORBIT" Fan very economical to run, and the full speed of approximately 1500 r.p.m. can be reduced by means of the three speed regulator which is fitted in the Base of the Fan.

The A.C. Fan Motor is of the induction type.

THE CABLE ACCESSORIES Co. LTD. TIPTON, STAFFS.

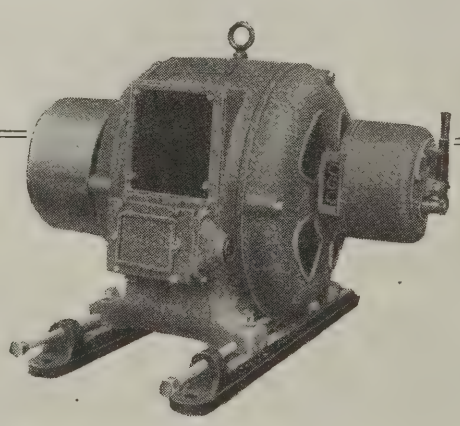
Ask those who have run PARKINSON Motors for years

Ask them how the bearings stand up to heavy work and they'll tell you that Parkinson Ball and Roller Bearings *never* give a moment's trouble.

Designed to be Foolproof —they run year after year without attention. There's no constant greasing necessary — no cleaning — for Parkinson Bearings are so well housed that no grease can leak out and no dust or dirt get in.

Even after years of hard service, no appreciable wear is apparent. The Rotor remains central and there's no possibility of trouble due to rubbing against the stator windings.

Such dependability is to be found in every detail of construction. That is why Parkinson Motors are to-day giving such efficient service and performing the most arduous duties with perfect freedom from trouble.



This letter to us is just typical of users appreciation of the Parkinson Bearings.

"We have five of your A.C. Motors, which have been working for six years—since 1919. According to instructions we recently took off the bearing plates on one of the 12 H.P. Machines to see if the bearing grease needed renewal, but we found both bearing and lubricant in first class order.

"The other motors have also run continuously during the six years without any trouble and without the ball bearings having been once regreased or renewed. The bearings appear to be as good to-day as they were when new.

Yours faithfully,

The SOUTH WALES CANISTER CO. Ltd."

BRIGHTRAY & GLOWRAY

NICKEL CHROME

WIRES & TAPES

are prepared by special melting and refining processes and are the purest alloys on the market. They are rolled and drawn **BRIGHT** but are sent out to customers with a firmly adherent black oxide coating. This oxide film which forms when ***bright*** wire is heated in air or pure oxygen is highly refractory and acts as a protecting and insulating covering.

BRIGHTRAY and **GLOWRAY** wires and tapes can be supplied **BRIGHT,** but we strongly advise the normal treatment described above since all nickel-chromes turn black on first heating to redness and in so doing alter their electrical properties thus introducing a factor of error in design calculations. Manufactured from the raw material by

QUALITY

THE certainty that the equipment installed in a power station or a factory will steadily improve in efficiency from year to year is of more value than heavy cash reserves. It means that capital has a high and a constant earning capacity.

There is a goodwill in quality which has a potency greater than spectacular display. The customer who knows that the power station or the factory is equipped with plant made by BEAMA firms has no hesitation in opening up business; experience has taught him that the BEAMA tradition for excellence is a very real thing.

Every product manufactured by BEAMA firms bears the stamp of quality—quality which has been established through constant research into materials and processes. BEAMA tradition is based on the combination of the modern manufacturing conditions and skilled workmanship of the highest standard.

BEAMA machinery and apparatus stand at the pinnacle of modern engineering science.

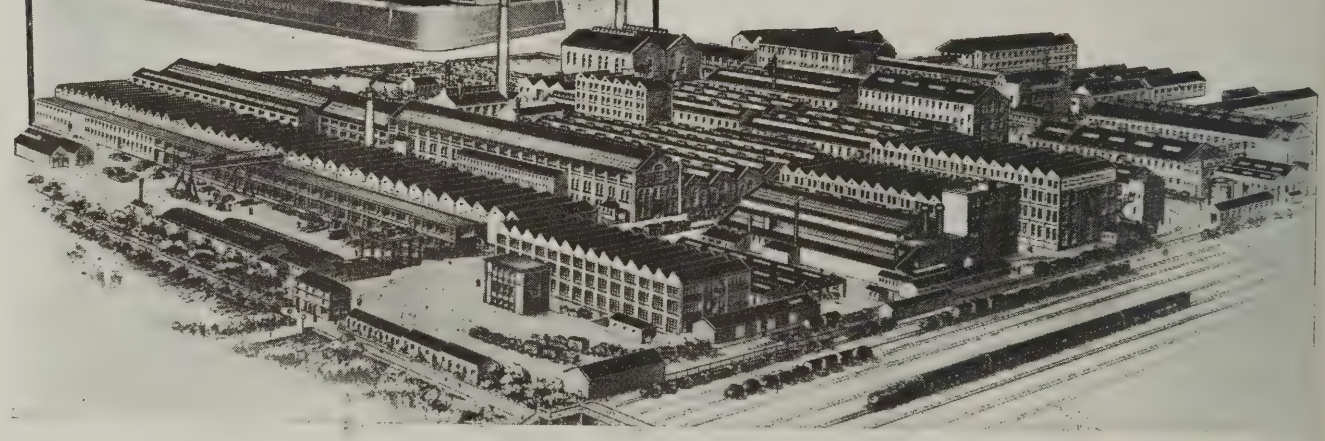
B T-H

Rugby Works



for **Heavy Electrical Plant, Traction Equipments, Mazda Lamps and B.T.H. Radio Valves.**

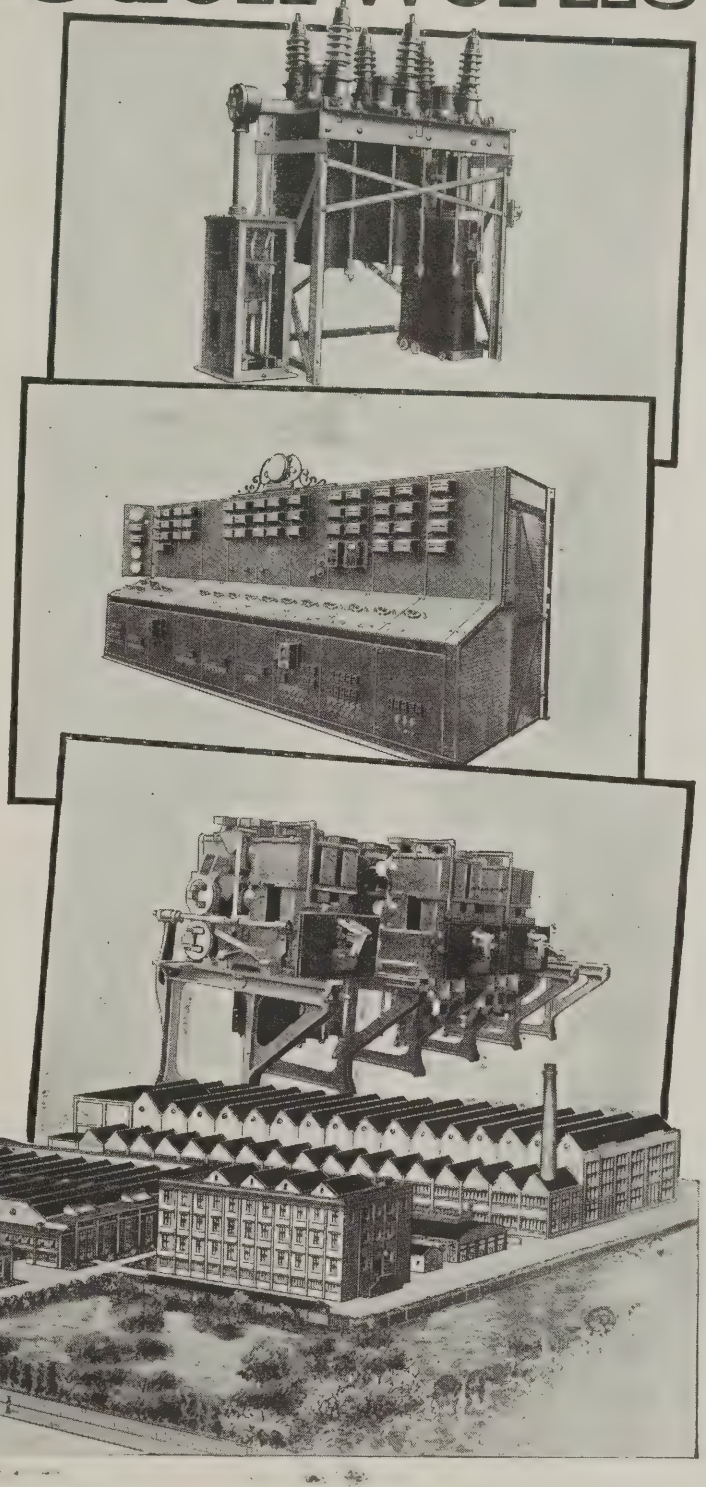
The B.T.H. Rugby Works, which are illustrated below, are devoted to the production of all types of heavy electrical plant and turbine-driven machinery.

Separate shops are devoted to the different types of plant and, throughout the entire works, the manufacturing facilities are such as to ensure that high standard of production and workmanship which is characteristic of B.T.H. products.

It is in these works also that the Mazda Lamp and B.T.H. Radio Valve factories are situated.

The British Thomson-Houston Co., Ltd.

ELECTRICAL ENGINEERS AND MANUFACTURERS

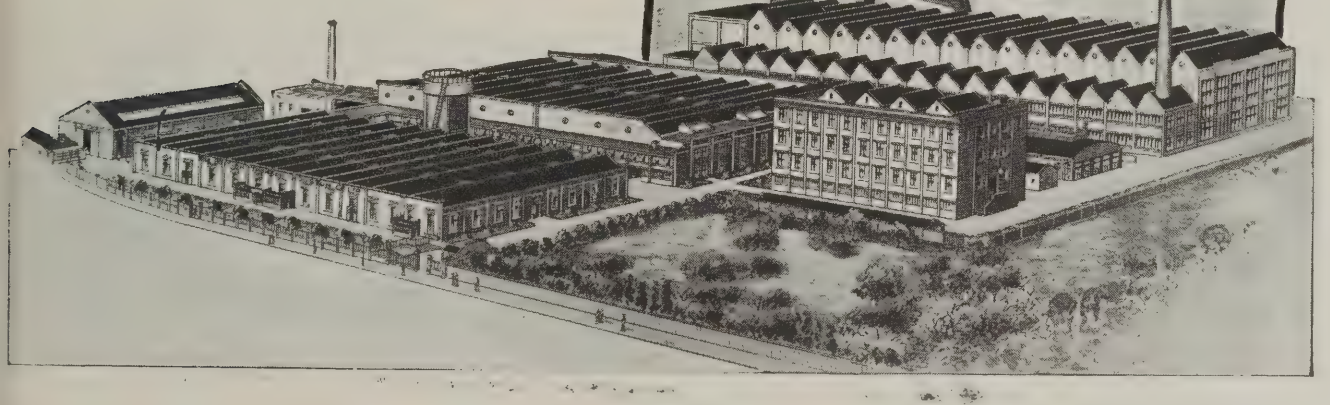


Head Office: Rugby, England. London Office: "Crown House," Aldwych.

Works: Rugby, Birmingham, Willesden, Coventry and Chesterfield.

B T-H

Willesden Works



for **Switchgear**

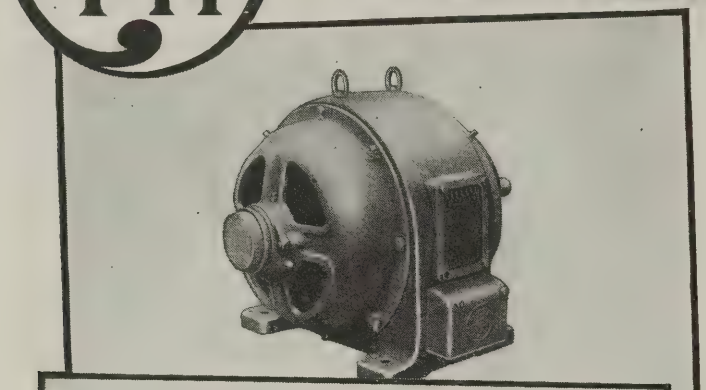
The B.T.H. Willesden Works, shown in the illustration, are devoted entirely to the manufacture of switchgear.

These works produce all types of switchgear for Municipal and Railway purposes and a very large quantity of switchgear, of every variety, for Industrial and Mining services.

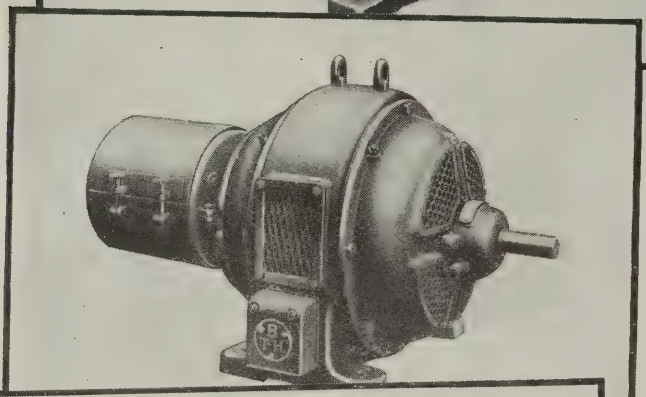
In addition to being the originators of the "truck type" and many other forms which are in universal use to-day, this Company has always maintained a very high reputation for reliable switchgear.

The British Thomson-Houston Co., Ltd.

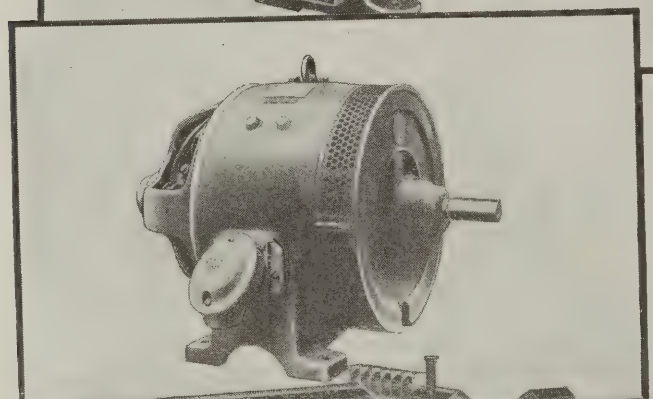
ELECTRICAL ENGINEERS AND MANUFACTURERS



Head Office: Rugby, England. London Office: "Crown House," Aldwych.



Works: Rugby, Birmingham, Willesden, Coventry and Chesterfield.



B T-H

Birmingham Works

for **Electric Motors & "Fabroil" Gears.**

The B.T.H. Birmingham Works, at Blackheath, which are illustrated below, are devoted to the production of electric motors of all types.

These works have been designed for the most up-to-date methods of mass production and the alternating and direct current motors manufactured include all sizes smaller than the heavy machines constructed in the Rugby Works.

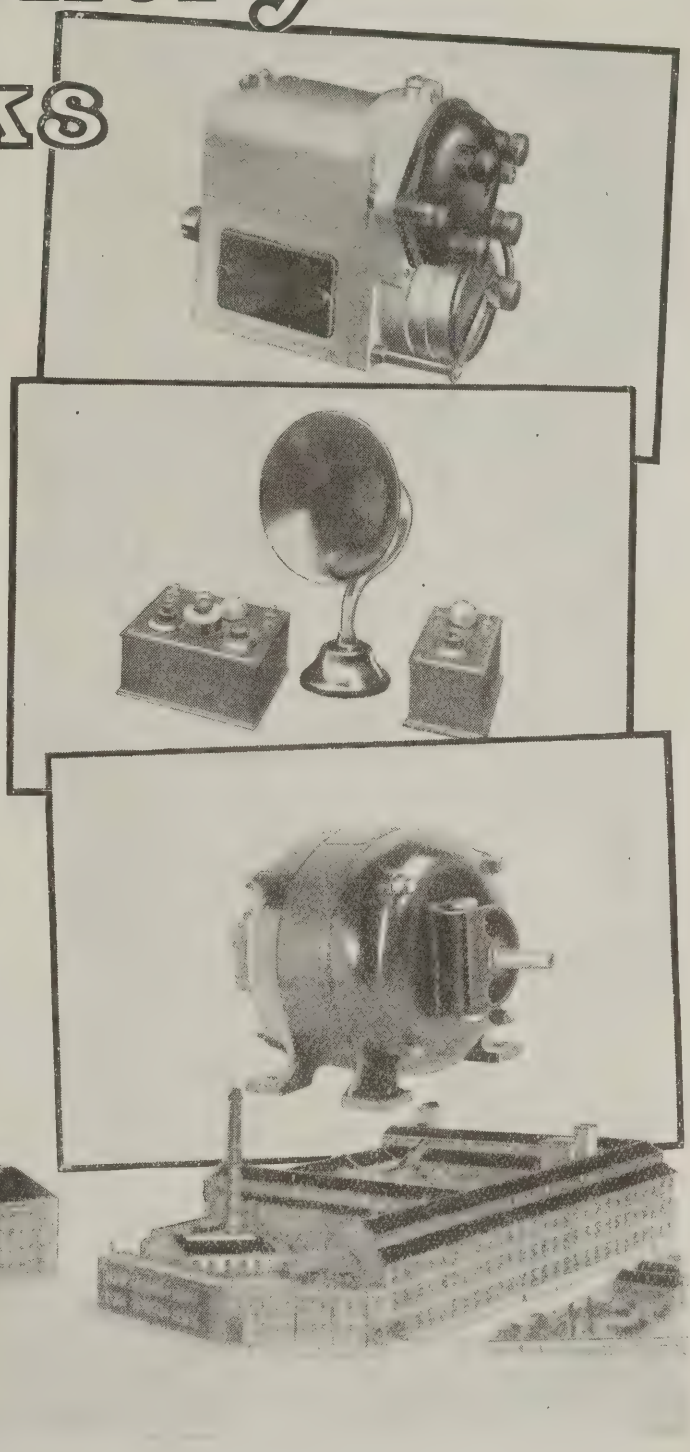
In addition to motors for every Industrial and Mining service, these works also manufacture the well-known "Fabroil" Silent Gears.

The British Thomson-Houston Co., Ltd.

ELECTRICAL ENGINEERS AND MANUFACTURERS

Head Office: Rugby, England. London Office: "Crown House," Aldwych.

Works: Rugby, Birmingham, Willesden, Coventry and Chesterfield.



B T-H

Coventry Works

for **Radio Apparatus, Magnetos and Small Electric Motors.**

The B.T.H. Coventry Works, consisting of two adjacent factories, are devoted to the manufacture of Radio Apparatus of every description, Magnetos for motor vehicles and aircraft, and Fractional Horse-power Motors for industrial and domestic use.

The modern methods of production and the good workmanship which prevail in these works are such, that B.T.H. magnetos, for example, have assisted in attaining practically every British aerial record and many other notable achievements abroad.

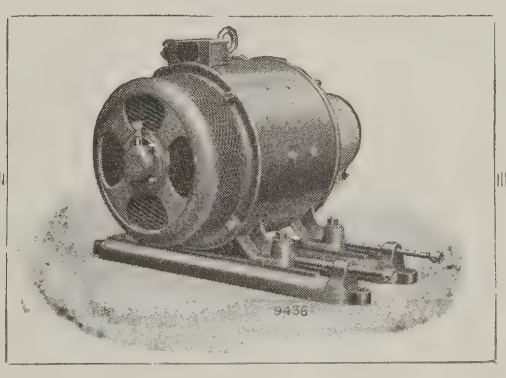
NEWBRIDGE
BRITISH NEWBRIDGE WORKS BATH **MADE**

ELECTRIC TIME SWITCHES

Special Features of their Construction—1.

(*a*) The clockwork movement is centrally wound and winding does not disturb the dial or interfere with the set times of lighting and extinguishing.
(*b*) Winding does not stop the movement, and power is also maintained during this operation.
(*c*) There is no backlash in the dial, resulting in accurate and easy setting to time.
(*d*) The tappets are discriminating, *i.e.*, the "ON" tappet cannot turn "OFF" and *vice-versa*.
(*e*) The regulator is easily accessible.
(*f*) All necessary operations are independent of one another, and the tappets can be set to operate at any desired time—and not to a quarter-hour notched dial.



Our next Announcement—No. 2—will deal with the high-class Escapement fitted to Newbridge Time-Switch movements.

Please write us NOW for a copy of our new Catalogue "E." Much useful information is contained therein with regard to Newbridge Time Switches for every purpose.

SIEMENS

"ZED" SAFETY FUSE TEAK DISTRIBUTION BOXES

— COMPETITIVE TYPE. —

The smallest and most compact double pole fuse box of robust construction, made to a high standard of quality, perfect in every detail and competing in price with low grade bridge type fuse boxes.

SIEMENS

IMPROVED "ZED" SAFETY FUSES
(INCREASED RANGE).

The advantages of using a fuse system of known dependability cannot be over- emphasised, and to meet this demand the "ZED" Safety Cartridge type Fuses have been developed. These fall into three groups :—

Group 1. **Medium pressure heavy duty Fuses 250-750-volts, available for currents up to 200-amperes.**

Group 2. **Medium pressure heavy duty Fuses 500-750-volts, available for currents above 200-amperes.**

Group 3. **High Tension Fuses 750-3,000 volts, 2-1,000-amperes.**

Supervising Electricians, Central Stations, Tramway and Consulting Engineers, will be specially interested in the higher capacity of "ZED" Fuses, and the new high voltage types, and we should appreciate the opportunity of demonstrating our latest productions.

— NEW ILLUSTRATED CATALOGUE No. Z 110 WILL BE SENT ON APPLICATION. —

Reg. design.

FIREBLAZE. (3 kW.) Artistic appearance: effective bold front.

Reg. design.

NEWBERRY. The Newberry Model is designed on entirely new lines. A special feature is that the element is completely hidden and does not mitigate the coal fire effect. The heat is directed to the floor level, thus ensuring perfect heating.

FYGLO. (3 kW.) The Fyglo has been specially produced to meet hiring scheme requirements. The problem of cheap renewal of elements has been solved: the initial cost is less than 17/- per kW. The fire effect in this model is obtained without lamps.

PIONEERS

Berry's Electric Ltd., were The Pioneers of the Electric Fire with the coal fire effect.

The Magicoal Fire is the original fire with the flickering enchantment indistinguishable from a living coal fire.

The coals are not just pieces of coloured glass but are manufactured from specially prepared materials to represent coal in its various stages of combustion; and when out they have the appearance of an unkindled fire.

Scientific construction has been made compatible with artistic design.

No dirt and ashes are made, whilst labour is reduced to the touch of a switch.

In addition to its unparalleled heating efficiency the Magicoal Fire gratifies the natural love of the genial fireside.

We welcome enquiries for export terms.

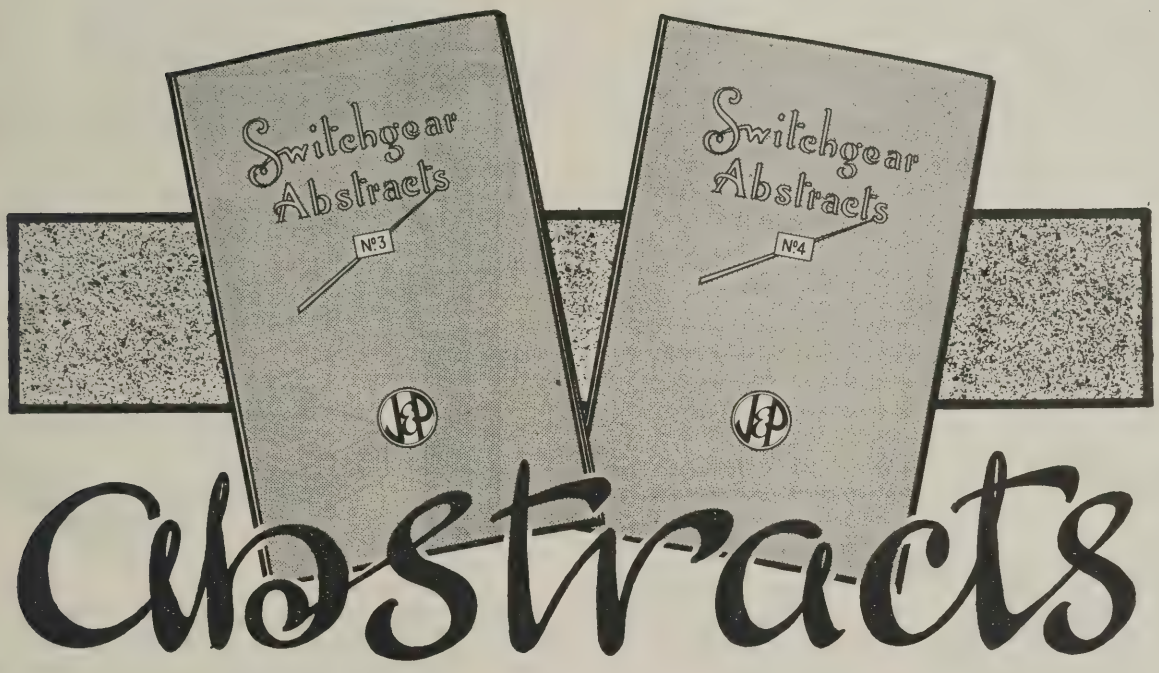
ONE OF THE J&P. PAGES

Switchgear

This is a broadcast invitation to all readers of "The Electrical Review," who are interested in the purchase of Switchgear, to place their name on our list for the regular receipt of these handy and exceedingly useful booklets.

We are publishing them periodically—month by month—and their reception is certainly rivalling our earlier series of a similar publication on transformers.



We are endeavouring to make them in every way helpful, and in the series we intend to cover as exhaustively as space permits every phase of Switchgear manufacture, selection and maintenance.

Johnson & Phillips Ltd.

Branches in London (City), Birmingham, Bristol, Cardiff, Glasgow, Liverpool, Manchester, Newcastle-on-Tyne, Portsmouth and Belfast.

THE MARK THAT MEANS THAT "LITTLE MORE" IN QUALITY

ONE OF THE J.&P. PAGES

Abstracts

No. 1 deals with "Types of Switchboards and how to choose between them."
No. 2 with "Desirable features in the design of various types."
No. 3 with "Oil Circuit Breakers," and
No. 4 with "Instrument Transformers."

The booklets are all of uniform size and contain no advertisements, hence when you have collected the series it will be an easy matter to bind and make them into a bookshelf volume infinitely valuable for reference purposes.

Now, let us have your name and business connection.

Something Entirely New in Electric Boiling Plates

The "Cosmos" Enclosed Boiling Plate viewed from the underside.

After years of investigation and research, Metro-Vick Supplies, Ltd., take pleasure in introducing an Electric Boiling Plate, which successfully avoids the limitations of all previous designs.

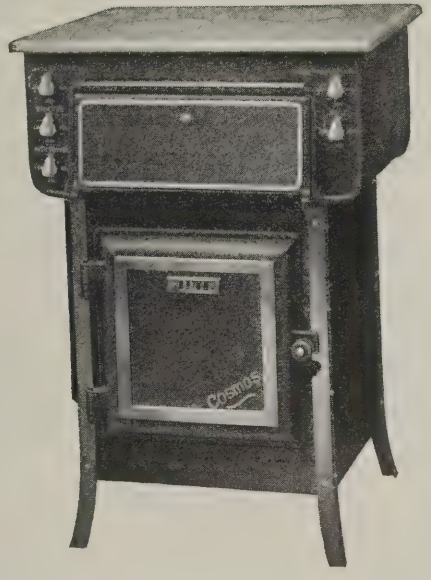
The

"COSMOS"

ENCLOSED TYPE ELECTRIC BOILING PLATE

(Fully Patented)

is manufactured under an entirely new and interesting process, resulting in a totally enclosed plate which is practically indestructible, thoroughly efficient and remarkably quick in operation.



The following figures obtained during tests by the National Physical Laboratory speak for themselves :—

2	pints of water	boiled in	8½	minutes	consuming	285	watt hours
3	"	"	10¾	"	"	360	"
4	"	"	13	"	"	435	"
5	"	"	15	"	"	505	"

Utensils used were aluminium with machined bottoms. These figures should be compared with those for other makes and with the average GAS RING.

"Cosmos" Enclosed Boiling Plates practically cut out maintenance charges and give more satisfaction to users.

For further details send for a copy of List 150/12 (Sup. 1)

"Cosmos" Enclosed Boiling Plates are now fitted to "Cosmos" Cookers.

SITUATIONS VACANT.

Latest time for receiving, 5 p.m. Tuesday.

If letters are not to be delivered to certain firms or individuals (if known), instructions to that effect should be sent to the Manager of the ELECTRICAL REVIEW, who will do his best to carry out such instructions. Letters of applicants cannot in such cases be returned to them, nor can the names of Advertisers using a number in any way be disclosed.

Original Testimonials should never be sent.

GENERAL MANAGER AND ENGINEER.

THE Rhondda Tramways Company, Ltd., requires the services of a General Manager and Engineer at the commencing salary of £1,200 per annum.

The Company operates a system of tramways in the Rhondda Valley, South Wales, 21 route miles in length, current being obtained from its own generating station. It also has a fleet of 40 motorbuses operating services mainly outside of the Rhondda Valley.

Application in writing, giving full particulars of qualifications and experience, together with copies of not more than three recent testimonials, should be addressed to the Managing Director of the Company, 62-63, Queen Street, London, E.C.4, and must be received not later than the 5th July, 1926. 464

ELECTRICAL TRADES UNION.

Hackney Borough Council.

THE Hackney Borough Council has been declared "Black." Before any member of the Electrical Trades Union can accept any employment, either directly or indirectly, for this Council he must first obtain permission from the London District Committee of the Electrical Trades Union.

W. J. WEBB,
3121 London District Secretary.

Cheap prepaid Advertisements are inserted under this heading at the rate of One Penny Per Word (minimum 1s.). Three Consecutive Insertions for the price of two if ordered and prepaid with first insertion.

BATTERY BOOSTERS.

WESTMINSTER Electric Supply Corporation, Ltd., 6, Eccleston Place, S.W.1, have for disposal two Battery Boosters.

Each Set consists of two generators driven by a 400-volt, d.c. motor. The generators in each booster can be coupled in parallel or in series, giving an output of 1,050 amperes at 70 volts or 2,100 amperes at 35 volts.

The machines are of the Lancashire Dynamo & Motor Company's manufacture, and can be seen at the Eccleston Place Sub-station of the above Company. 535

EXTRAORDINARY VALUE.

ENGLISH made Charging Dynamos, brand new, shunt wound, ball bearing; very substantially built; 1,400 r.p.m.

1 kW, £9.
½ kW, £6 10s.

WM. E. CULKIN & Co., School Close Mills, Neville Street, Leeds. 5285

MOTORS AND GENERATORS IN STOCK.

440/500 VOLTS, D.C.

100-KW Generator, by Phœnix, 500 revs., 6 poles and interpoles, shunt.
80-h.p. Motor, by B.T.H., 795 revs.
43-h.p Motor, by Electromotors, 640 revs., shunt, interpole, with Igranic starter.
35-h.p. Motor, by Siemens, 400 revs., shunt, interpole.
30-h.p. Motor, by B.E.P., 650 revs., shunt, interpole.
22-h.p. Variable Speed Motor, by Halls, 350/900 revs., compound, interpole, with Brookhirst control pillar.
20-h.p. Variable Speed Motor, by Electromotors, 340/1,200 revs., compound, interpole, with Brookhirst automatic controls.
20-h.p. Motor, by Westinghouse, 2,000 revs.
Three 17-h.p. Motors, by Electromotors, 510 revs., shunt, interpole, and Igranic starters.
16-h.p. Motor, by Westinghouse, 1,520 revs., shunt, interpole.
15-h.p. Motor by Mavor & Coulson, 800 revs., compound, interpole.
Two 12-h.p. Wright Motors, 700 revs.
10-h.p. Variable Speed Motor, by Halls, 1,150/1,250 revs., shunt, interpole, ball bearings.
10-h.p. Motor, by G.E.C., 800 revs.
10-h.p. Motor, by G.E.C., 1,450/1,600 revs., shunt, interpole.
10-h.p. Motor, by Electromotors, 1,000 revs.
New 10-h.p. Motor, by Cutting Bros., 1,000 revs., shunt, interpole, Igranic starter.
10-h.p. Motor, by Westinghouse, 900 revs.
10-h.p. Motor, by Westinghouse, 850 revs., Brookhirst starter.
7½-h.p. Motor, by Westinghouse, 900 revs.
Three 7½-h.p. Motors, by Vickers, 1,060 revs., shunt, interpole.
7½-h.p. Motor, by Mather & Platt, 1,500/1,700 revs., shunt, interpole, ball bearings.
7½-h.p. Motor, by Rees Roturbo, 1,650 revs., shunt, interpole, with Brookhirst starter.
Three 5-h.p. Motors, by Vickers, 700 revs., shunt, interpole.
3-h.p. Motor, by McClure & Whitfield, 600 revs., shunt, interpole.
½-h.p. Motor, by B.T.H., back geared, 1,750/255 revs.

THOMAS MITCHELL & SONS, LTD., Bolton. 429

MACHINERY FOR SALE.

MOTOR-Generator Set, comprising 200-h.p., 400-V, 3-phase, 50-cycles, S/r Motor with S/c and B/l gear, 418 r.p.m., coupled flexible to a d.c. generator, 22.5 V, 5,500 amps., with exciter, 4 pedestal bearings and bedplate, T.P. circuit breaker, liquid starter, d.c., main switch cubicle and rheostat panel, volt and ammeters complete. All by the G.E.C. Condition as new.
30 kVA Brush transformer, 3-phase, 50 cycles, 400 V to 110 V.
5-h.p., 200-V, 2-phase, 50-cycle, 1,440 r.p.m. slip-ring Motor, with S/c and B/l gear.
4½-h.p., 220-V, 1,200 r.p.m., d.c. Crompton Motor; has been running as a generator.
½-h.p., 220-V, d.c. buffing and polishing Motors, 2,000 r.p.m., mounted on cast base with self-contained starters.
½-h.p. ditto, ditto.
All the above are in first-class condition and are offered at very low prices.

ARTICLES WANTED.

Advertisements are inserted under this heading at 1s. 9d. per line.

A 2½-kW Lighting Set wanted, 25/30 volts, petrol or paraffin preferred.—Clinkham Works, Halling. 442

ACCUMULATOR Plates, worn or otherwise, Scrap Metals, &c., bought for immediate cash. Small or large quantities. Top prices paid. Complete batteries bought on site. Highest references.—Bentley, Brown & Co., 59, Gracechurch Street, London, E.C.3. Telephones: Royal 4818 and 4819. 4902

ASK us to buy your Scrap Electric Cable, old Plant, and non-ferrous Metals. Highest prices paid.—Jewell & Son, Oldbury, near Birmingham. Telephone: Oldbury 96. 13

ABSOLUTELY top market prices paid for Platinum Scrap (£24), large or small quantities. Be convinced. Call or post.—A Short, Metal Depot, 47, Charing Cross Road, London. 5132

BABCOCK Boilers wanted, 10,000 to 30,000 lb. each, for 200 lb. press. Must be in first-class condition; preferably with economisers.—5290, Electrical Review, 4, Ludgate Hill, London.

BABCOCK Boiler wanted, in good condition, working pressure 300 lb., having a normal evaporation of 3,500 lb. of water per hour.—499, Electrical Review, 4, Ludgate Hill, London.

BATTERIES (Storage), old Dynamos, Transformers, Arc Lamps, Electric Meters, Scrap Cable, Metals or Machinery of any description purchased. Distance no object.—A. Learoyd & Son, Bridge Works, Heatherley Street, Clapton, London. Telephone: Clissold 2278. Tele. address: "Frangible, Lowclap, London" Established 1860. 241

ELECTRIC Motors wanted, up to 25 h.p., 400/480 volts, slow speed preferred. Also ½-5 h.p., 110 volt, d.c. Veritys preferred.—Simpson, 61, Pollards Hill South, S.W.16. 488

SCRAP Accumulator Plates and Sediment wanted. As actual smelters we are able to pay top prices, any quantities.—Please 'phone or write Elton, Levy & Co., Ltd., Brettenham Road, Edmonton, London, N.18. Telephone: Tottenham 2412-3-4. 484

SECOND-Hand House Lighting Plant, between 1 and 2 kW; inspectable in the North of England.—Ferrier, Rainton House, Fence Houses, Durham. 5263

SMALL size Bi-polar Dynamos, Thomas Parker make only, any voltage.—Taylor, 1, Sandringham Road, Birkdale, Southport. 5138

WANTED, Manufacturers for Conduit Boxes to pattern; quantities.—480, Electrical Review, 4, Ludgate Hill, London.

WANTED, 12- to 18-kW Dynamo, 110 volt, and one 5-h.p. and two 3-h.p. Motors, on Slide Rails and Regulator. Starters. Full particulars, please, and prices.—Wilson, Barmby Moor, York. 5287

200-V, 60/75-A, d.c. Dynamo, shunt or comp.—Electric Supply Co., Leyburn, Yorks. 5276

£23 10s. oz. paid for clean Platinum Scrap. Call or post. Immediate cash.—L. Stern, 5, Bold Street, Liverpool. 3295

AGENCIES.

Advertisements are inserted under this heading at 1s. 9d. per line.

ADVERTISER desires to represent firms of repute, on commission basis, in Eastern Counties; own car.—5265, Electrical Review, 4, Ludgate Hill, London.

GLASGOW Electrical Suppliers with large storage accommodation and street front display (five windows), wish to hear from Firms wishing to open up or extend their Business in Scotland for all classes of Electrical Goods. Can offer intelligent personal attention. Own car for delivery and travelling. Three 'phones. Interview either in London or Glasgow. Reliable goods and competitive prices first consideration.—521, Electrical Review, 4, Ludgate Hill, London.

LEADING Continental Lamp Manufacturers are still open to appoint Agents for the following districts:—Birmingham and District; District of Northumberland and Durham; Southern Ireland. Applications only entertained from well established firms capable of handling large business in all types of electric lamps sold under E.L.M.A. conditions.—Replies should state territory covered, number of travellers employed, storage facilities available, and office accommodation, to 270, Electrical Review, 4, Ludgate Hill, London.

OLD-Established Firm of Electrical and Mechanical Engineers, with offices and stores in Newcastle-upon-Tyne, is open to Represent manufacturers desirous of doing business with the collieries, works, and electrical contractors in the North-East Coast area. Highest banking and commercial references.—353, Electrical Review, 4, Ludgate Hill, London.

REPRESENTATION.—Old-established Firm of Engineers, very well known and with wide connection in the Midlands, offices in Birmingham, desire additional Sole Agency for Electrical, Civil, or Mechanical Engineering work. The Principals are fully-qualified engineers and have wide business experience. Replies treated in the strictest confidence.—431, Electrical Review, 4, Ludgate Hill, London.

PARTNERSHIPS.

Advertisements are inserted under this heading at 1s. 9d. per line.

ENGINEERING and Allied Partnerships, Directorships and Businesses required, London and Provinces, £1,000 to £30,000, for many technically trained investors.—Arnold & Co., 143, Cannon Street, E.C. Estab. 1891. No result, no charge. City 7222. 525

PARTNER wanted for old-established Electrical and Wireless Business, with the option of purchase.—Ino Lamps, Ltd., 35, Aldermanbury, E.C.2. 5154

PARTNER wanted in established and successful Electrical and Wireless Wholesaler's Business on the North-East Coast; excellent opportunity for young man with £5,000 capital.—5260, Electrical Review, 4, Ludgate Hill, London.

BUSINESSES FOR SALE AND WANTED.

Advertisements are inserted under this heading at 1s. 9d. per line.

A GOOD Electrical and Radio Business.—Good stand and connection, living accommodation; town about to take supply; good living in wireless alone.—Particulars from Electrical Supply Stores, Barnoldswick, Yorks. 5288

ELECTRICAL and Wireless, d.f. Shop, main road. Bargain for energetic man. Stock, goodwill, and fixtures, £250. Rent £12 per month; long lease.—Pennington, Ltd., Railway Station, Richmond. 5283

ELECTRICAL Trading Business in North London for Sale. Good net profits. Price for lease, stock and goodwill, £2,750.—Write 534, Electrical Review, 4, Ludgate Hill, London.

WIRELESS and Electrical Apparatus. Portsmouth. Main road shop, showroom, 2 workshops. Fully equipped. Very low rent. Takings, £40-£50 p.w. Scope double. Price, including valuable stock, plant, &c., £1,000.—Apply Leslie's, 88, Fleet Street, E.C.4. 5262

MISCELLANEOUS.

Advertisements are inserted under this heading at 1s. 9d. per line.

AMBITIOUS Men are wanted to apply at once for free booklet giving full information regarding the A.M.I.Mech.E., A.M.I.E.E., A.M.I.A.E., and all other technical examinations. Tuition guaranteed until successful—lowest fees. Courses in all Engineering subjects leading up to the A.M.Tech.I. qualifications.—Write at once, stating branch of Engineering in which you want to specialise, to The Technological Institute, 231V, Strand, London, W.C.2. 5200

CASTINGS: Aluminium, Brass, Gunmetal.—A. J. Andrews, Audrey House, Ely Place, London, E.C.1. Holborn 1755. 524

"Insulators of Quality"

The high standard of Quality maintained in all our manufactures is here evidenced in our

British Post Office Type Insulators,

which, being the embodiment of perfection in design, material and workmanship, are

Electrically Perfect,
Mechanically Accurate, and of
Exceedingly Tough Material.

The glaze on these insulators is ONLY for the purpose of keeping them clean and improving the surface insulation, but, apart from this glaze, they are PERFECTLY VITREOUS THROUGHOUT.

Post Office Types, as illustrated, can now be delivered from stock, and other types can be supplied within three weeks.

Let us quote you our lowest prices for export.

SOME ADVANTAGES
OF OUR TIME LIMIT RELAYS:

TYPE RI & RIK
WITH COVER AND SCALE REMOVED.

1.—Low initial cost and volt-ampere consumption.

2.—Sound engineering construction throughout—no cords or delicate parts.

3.—"Floating" is impossible.

4.—The rotating disc can be seen at a glance, signifying that the relay is in working order.

5.—Wide range of time and current settings.

6.—Can be adjusted to trip instantly if desired with 4, 6 or 8 times the current setting. This feature is separate and distinct from the time setting.

7.—The relay coil is short circuit proof and the contacts have a quick and definite action.

8.—If you are interested write us. We shall be pleased to supply full information and arrange demonstration at our Walthamstow Works.

Electricity Undertaking.

TENDERS FOR GENERAL STORES.

THE Electricity Committee of the Corporation are prepared to receive Tenders for the supply of General Stores required in connection with the Electricity Undertaking for the period of twelve months, commencing on the 1st day of July, 1926. Particulars and forms of tender may be obtained on application to the Electricity Engineer at the Electricity Station, Talbot Street, Nottingham, on the payment of a deposit of 5s., which will be returned on receipt of a *bona-fide* tender.

The Committee will not consider any tender except on the authorised form, which must be delivered to the undersigned, in the special envelope provided for the purpose, on or before Tuesday, the 6th day of July next.

The Committee do not bind themselves to accept the lowest or any tender, and tenders will only be accepted from persons conforming to the conditions as regards paying the local standard rate of wages, and to the working rules of the Nottingham district applicable to the various trades

W. J. BOARD,

Chloride Batteries

behind the scenes
at
GLENEAGLES

The unseen causes of effects, much appreciated, are often forgotten—if indeed their existence is realised at all.

Out of sight at Gleneagles is a Chloride battery—providing current for lighting, heating, and the hundred and one modern uses of Electricity.

There are Chloride batteries at very many country houses, in telephone exchanges, and large central power stations—unheard of, because they do their work quietly, efficiently, and away from the public gaze.

Use Exide batteries for the car and wireless.

Clifton Junction, near Manchester.

Not one word lost!

JUST one man talking to a vast crowd. Talking in his ordinary voice, without the slightest indication of strain, and without raising his voice to any greater intensity than is required in ordinary conversation.

Further, every single person in the audience can hear every spoken word.

This is made possible by the installation of the Standard Public Address Systems.

These Systems have been installed in many of our great Concert Halls, Lecture Halls, Cathedrals, &c., with absolute success, and we should be pleased to advise you as to the best method of overcoming the acoustic difficulties of any building in which you may be interested.

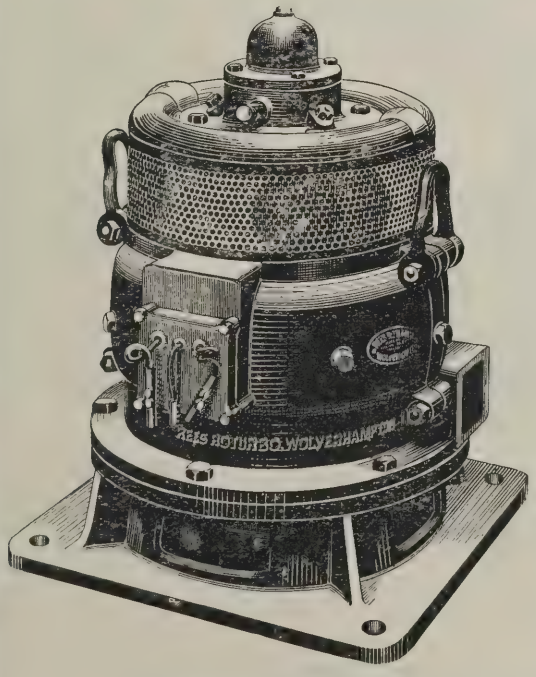
The ARORA "103"

RAPID BOILING PLATE No. 103.



THE ARORA "103" Rapid Boiling Plate has been evolved to meet the demand for a boiling plate which will rapidly boil small quantities of liquid—a point of importance in hot weather.

By detailed research and with slight modification the effective efficiency of this Boiling Plate has been increased 8% and it will form a most useful addition to existing electric kitchens.

Tell your customers of the efficiency of the Arora "103" Rapid Boiling Plate.

The Arora Cooking Apparatus List "E" 1926 fully describes it and will be sent on application.

MAINTENANCE A/c

How often do you get a report like this :—

"I have to report that the Main Switch on —— Service broke down —— etc."

Your Annual Maintenance A/c may be small or large, one cannot tell; isn't it worth while to ensure at any rate that your Switchgear Maintenance is negligible or at the least reduced to a minimum ?

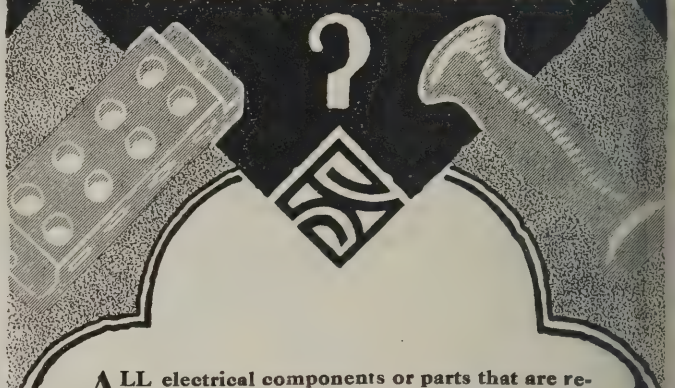
INSIST ON

SUPERIOR SWITCHGEAR

Above all others

The Switchgear that is BUILT TO LAST and designed to GIVE GOOD SERVICE.

BRITISH BUILT
by BRITISH LABOUR
with BRITISH MATERIAL



WM. SANDERS & CO.,

Falcon Electrical Works,

WEDNESBURY.

LONDON OFFICE:— **128, SHAFTESBURY AVENUE.**

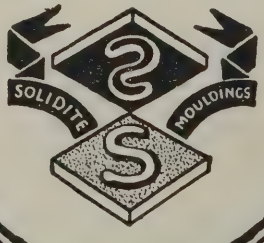
WHY NOT HAVE THEM MOULDED ?

ALL electrical components or parts that are required to insulate should be moulded. Let this be your inflexible maxim. Porcelain will crack. Wood will split. Metal — even when lined with fibre—does not insulate.

Covers, bases, handles — these are typical examples of parts that should be moulded. But the choice of the most suitable moulding material for a particular case calls for expert knowledge.

The Solidite Manufacturing Company—long famous in the moulding trade—produces mouldings of every description in a variety of grades. The four chief are :—

1. **BAKELITE.**—For intricate mouldings of all types combining accuracy, high finish, insulation and heat-resistance.
2. **ESTEROID** (the new Cellulose material) where finish and accuracy are required in instruments, telephone parts, wireless components, &c.
3. **HEAT-RESISTING** Material for Switchgear connectors, bases, terminal blocks, &c., which have to withstand heat.
4. **PLASTIC COMPOSITIONS** where good and cheap mouldings are required for meter-blocks, handles, bushes, covers, &c.



Will you write us for quotations, particulars and advice, or may our representative call and discuss the matter with you ?

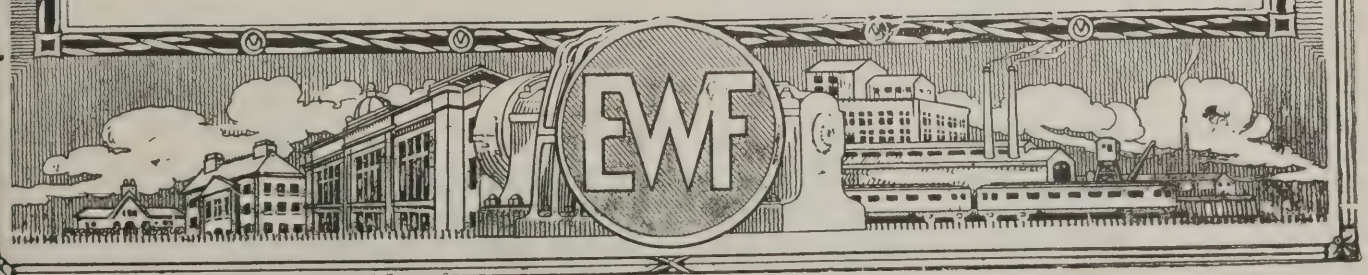
The Electrical Wholesaler's Federation

An Association of progressive Electrical Factors, the main function of which is to secure the efficient distribution of Electrical Supplies and Equipment.

Investigate

On enquiry you will find that the Electrical Wholesaler regularly carries in stock the products of several manufacturers making the same class of material or apparatus. Hence, in the Wholesaler's Showrooms you are able to make comparisons, and to conveniently select the type which most appeals to you.



This is only one little detail of the service rendered by the Electrical Wholesaler. His prices for individual articles are the best you can obtain. In the aggregate this is important, because it means that the actual cost to you of a mixed order is considerably less by reason of the time and labour saved in ordering, checking goods and invoices. Carriage charges, too, work out less, and there is not the worry attendant on sending back a large number of packing cases.

Investigate for yourself the advantages of dealing with the Electrical Wholesaler for at least your day by day requirements. Any member of the Electrical Wholesaler's Federation will be only too glad to go fully into the matter with you.

If you have not an account open with an Electrical Wholesaler, write to the Secretary for a full list of members — they cover the country.

THE ELECTRICAL WHOLESALER'S FEDERATION, LTD.,

19-21, Hatton Garden, London, E.C.

Why we say we can save you money

1 Because *others* say that we have saved money for *them.*

2 Because we have studied every type of lubrication problem for nearly half a century.

3 Because this experience has been used in the perfecting of our lubricants.

4 Because our technical advisors are able to give individual attention to your problems. The lubricants we recommend will assure the most satisfactory and the least costly operation. Write to Dept. 33 for free advice.

Don't strike!

Your screw will suffer

Of course, no self-respecting engineer would think of striking a screw.

We agree there are screws *and* screws, and some come jolly near deserving rough measures.

All screws look more or less alike to the ordinary layman, but ask the man in the blue overalls and note his smile of superiority upon the subject.

Bitter experience teaches such men to learn the history of every part of their machinery—even down to the smallest screw. For although not visibly working, each little screw plays its part in the functioning of each piece of machinery as an harmonious whole.

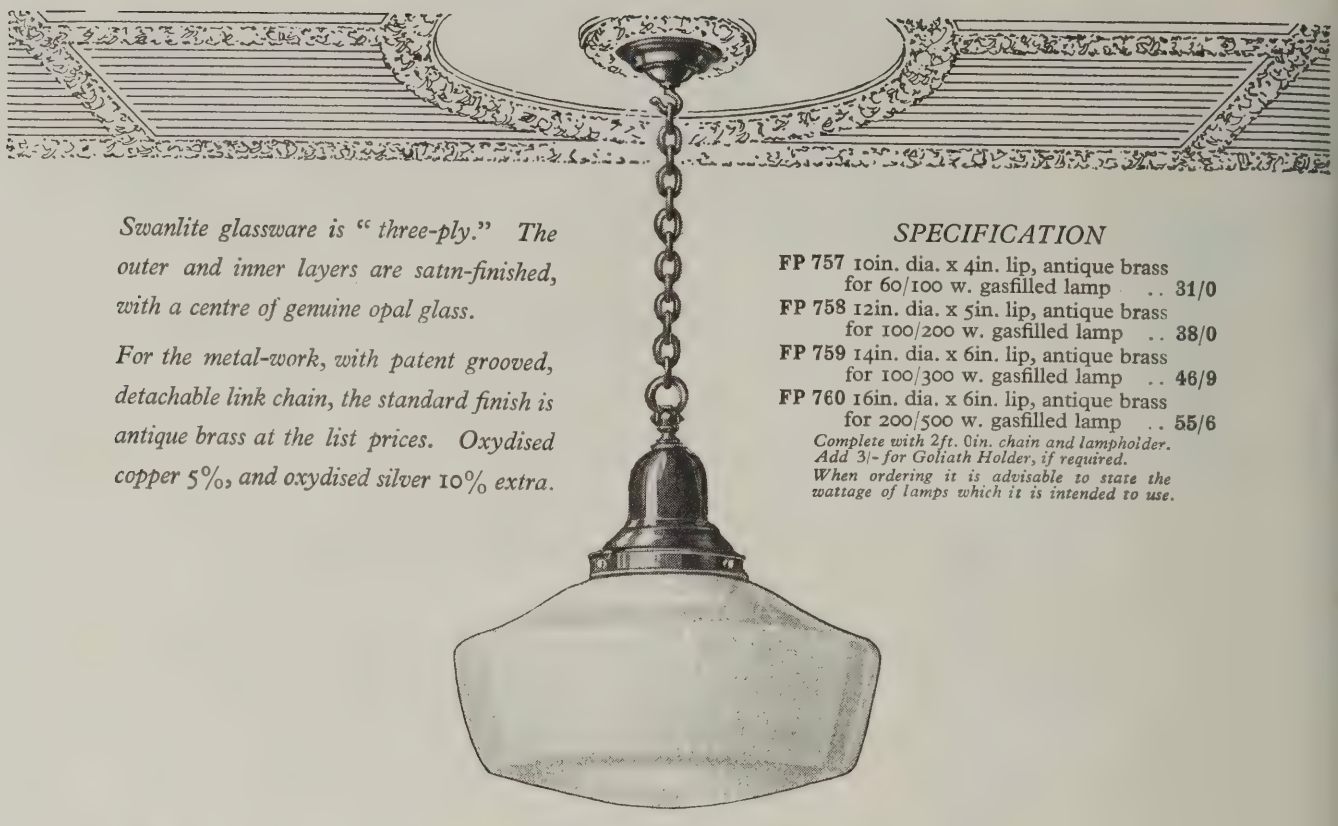
ORMOND Metal Screws are sound all the way through. The slightest flaw is eliminated and each thread must contribute to the ORMOND standard of super-excellence both in quality and finish.

Enormous demands call for huge daily outputs of ORMOND Machined Parts and Metal Screws. This demand is satisfied by the largest and finest Screw Plant in the Kingdom at prices that defy competition.

ORMOND will quote you the cheapest prices in the trade and guarantee highest quality products and a definite delivery date.

ORMOND UNDER-QUOTE FOREIGN MARKETS

Let ORMOND have your enquiries.
Large or small get prompt attention.



ENGINEERING "ORMOND" COMPANY LTD.

NEVER A SCREW LOOSE WITH ORMOND

Swanlite glassware is "three-ply." The outer and inner layers are satin-finished, with a centre of genuine opal glass.

For the metal-work, with patent grooved, detachable link chain, the standard finish is antique brass at the list prices. Oxydised copper 5%, and oxydised silver 10% extra.

SPECIFICATION

FP 757 10in. dia. x 4in. lip, antique brass for 60/100 w. gasfilled lamp .. **31/0**
FP 758 12in. dia. x 5in. lip, antique brass for 100/200 w. gasfilled lamp .. **38/0**
FP 759 14in. dia. x 6in. lip, antique brass for 100/300 w. gasfilled lamp .. **46/9**
FP 760 16in. dia. x 6in. lip, antique brass for 200/500 w. gasfilled lamp .. **55/6**

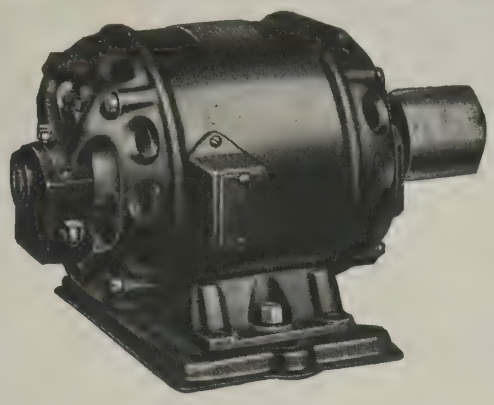
Complete with 2ft. 0in. chain and lampholder. Add 3/- for Goliath Holder, if required. When ordering it is advisable to state the wattage of lamps which it is intended to use.

SWANLITE

THE DUST-PROOF UNIT

The attractive powers of light can have a detractive influence on sales. The Swanlite sells because it *helps to sell goods*. Swanlite is strong light, glareless—unostentatious; detracting no undue attention to itself, but displaying goods to best advantage. Every Swanlite is another efficient sales help—and with this lighting efficiency there is true beauty of design.

The Swanlite is pleasing in appearance, sound in design, dust-proof—no corners, no ledges to harbour dust and, therefore, very easily cleaned. This beauty, efficiency and utility explains why so many of the largest and most progressive Stores, Hotels and Restaurants are now Swanlite-ing. Your attention is directed to further particulars above.



EDISWAN

THE EDISON SWAN ELECTRIC CO. LTD

S.W.2

They Keep a-Running"

1/4 Horse-Power Century Repulsion-Start Induction Single-Phase Motor.

A Motor You Can Forget.

CENTURY Repulsion-Start Induction Single-phase Motors—widely used on pumps, compressors, refrigerating machines and similar apparatus — are practically self-maintaining for at least a year.

1. The Century Wool-Yarn System of Lubrication assures proper lubrication for at least a year's continuous service —without re-oiling.

2. Filtering properties of the pure wool yarn used in the Century Wool Yarn System of Lubrication prevent abrasive particles and compounds from reaching the bearing surfaces.

3. Bearing housings are closed — as nearly dust-tight as it is possible to build them.

4. Bearings are made from the highest grade cast phosphor bronze, with machine-cut figure-8 oil grooves—large enough for life-time service—accurately machined to micrometer dimensions.

Built in all standard sizes from 1/8 to 40 horse-power—temperature rise not more than 40° Centigrade.

Electric light for you

THE DANGER SIGNAL.

THERE is a danger signal on every "Austinlite" Electric Lighting Set, which does even more than most railway signals.

It not only warns when there is something wrong, such as no petrol in the tank, but it shuts the set down, and won't allow it to be run until the trouble is remedied.

This is only one of the points which enable you to recommend "Austinlite" with every confidence to your customers.

Made in ½ kW. outputs and upwards, for hand control, semi-automatic and full automatic working.

PRICES FROM £62 UPWARDS.

Trade Terms on request.

A SUGGESTION TO CONTRACTORS & OTHERS

June and July need not necessarily be such "dead" months as generally assumed. There are probably many of your customers who (while deferring extensive alterations to their lighting equipment till later) would welcome having some of their obsolete brackets removed and replaced by the inexpensive distinctive models we offer. Why not suggest to some of your customers that the time to do these little jobs is NOW?

Incidentally—it may lead to your getting the bigger job later on.

LAWTON FITTINGS

LAWTON BRACKETS—A REMUNERATIVE AND QUICK-SELLING LINE.

We can definitely claim that our Swan Necked Brackets are far superior in Quality and finish than others at the same price—are far better value, and offer really remunerative business to all handling them.

There are no seams to crack or gaps in the tubing—all of which is solid drawn and therefore seamless. General quality and finish are excellent – value is unparalleled, and Trade Terms most generous.

Write for our Complete List.

+ AND + AND +

Every battery you instal either adds to, or subtracts from your reputation. You are sure of a battery which adds and adds and adds if it is made by Pritchett and Gold and E.P.S. Company, Ltd.

+ Service. That a P. & G. or E.P.S. battery does the job, and keeps on doing it, is proven by the fact that there are several—not one, mind you, but several—such batteries working to-day which were installed 25 years ago. And they are the ***original*** batteries. Plates haven't been replaced from time to time until there's none of the original ones left. They're there *now;* and *working*.

+ Workmanship. The care with which such jobs as testing separators and burning-on bus-bars, even of lead-lining boxes—all small details, if you like, but *vital*—are done, should be seen. Any time, we'd be glad to show you our Dagenham Works.

+ Goodwill. When any man pays for the installation of a battery, he expects it to do its job. If it doesn't, he blames ***you***, not the manufacturer. It's ***your*** reputation which is made or marred. Therefore we suggest that you specify and instal the batteries whose makers realise and work up to their responsibility.

Write us for particulars and terms. Our technical staff, by the way, is always at your service.

Bigger profits—this way!

Electrical High-Frequency treatment has long been recognised by the medical profession as being invaluable ; consequently the demand for thoroughly efficient, yet low-priced equipment is enormous.

The Vio-Ray (Junior Model) Electrical High-Frequency Machine at 55/- (less generous discounts) is meeting these demands, and, being largely advertised in all leading medical journals, the demands are increasing. Shortly it will be advertised to the general public!

Take this big profit-making opportunity. Write for full particulars of the Vio-Ray machine **NOW!**

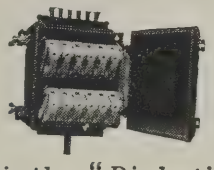
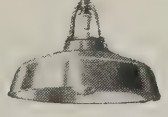
Some Products of

SIMPLEX CONDUITS



Simplex Conduits & Conduit Fittings

Simplex Terra-Grip Continuity System



Durex System of Electric Wiring

Simplex "Diaduct" Distribution Boards

Simplex Watertight Lanterns & Fittings

Simplex "Duralite" Steel Reflectors

Also Switch - Fuse Gear, Colliery Lighting Fittings, Window Reflector Signs & Lighting Fixtures.

When considering a Conduit Specification—

it is worth remembering that never yet was there conduit inquiry nor quotation but which differed on the one thing not specified—QUALITY: and each manufacturer quotes on *his* quality.

There are only 3 things which you can specify with exactness on a conduit order—grade, size and finish; everything else is left open—quality of material, processes of manufacture, workmanship, etc.

This "Everything else" in SIMPLEX CONDUIT conforms throughout to the high Simplex standards and yet whilst increasing its worth many times, increases its cost not at all over that of the product of any other firm of responsible electrical engineers.

May we send you copies of the catalogues listing any of the materials shown alongside? You will then have both confirmation of the claims in this advertisement and also fullest information as to where and what to order next time.

Simplex YOUR installations

—it means longer service at a lower cost per year and at no increased initial outlay.

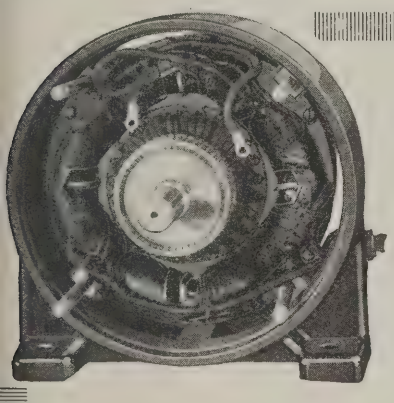
DYNAMOS & MOTORS

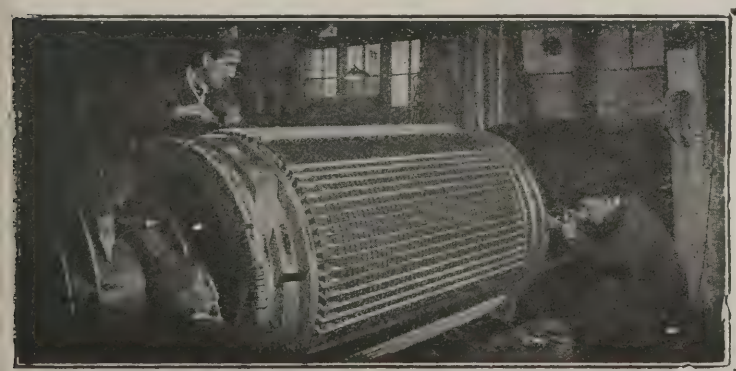


DIRECT AND ALTERNATING CURRENT

1 to 1,000 B.H.P.

The machines manufactured by us are the outcome of 40 years' experience in the design and construction of Dynamos and Motors for direct and alternating current circuits.

Many of our machines have been in continuous service for over 40 years in many parts of the world, and are still giving satisfactory service under the most trying conditions to which electrical machinery can be subjected.



SPECIAL MOTORS FOR CRANE SERVICE

Take a Batwin to Power

OBSERVE first of all that D.C. Batwins from 1/8 H.P. upwards are all of FOUR-POLE CONSTRUCTION which provides a balanced magnetic field. It produces better commutation and more even torque than is possible with 2-pole construction usually offered on small motors. Note the laminated pole pieces. The sturdy construction and the careful finish. BATWINS will bear the closest inspection.

TUCKER TELAC

TUCKER

Adjustment up to $\frac{3}{8}$" Illustration shows Switchplate fixed with rings.

ADJUSTABLE GRID BOXES

FOR USE WITH TUCKER SWITCHES & ACCESSORIES.

TUCKER adjustable grid boxes, illustrated and described in this announcement, contain many features which will prove interesting to Engineers. They are constructed to the Tucker standard of quality throughout, ensuring long and satisfactory service, low erection costs and perfect installations.

SPECIAL FEATURES.

Adjustment up to $\frac{3}{8}$".

All adjusting screws are turned in the same direction—

To the left—to raise, to the right—to lower.

The switchplate is always maintained at the correct distance from the Switches by being held firmly against the head of the adjusting screws which rise and fall with the grid.

The adjusting screws cannot be detached from the grid either before or after the Switches or Accessories are fitted.

The grid consists of a stout steel stamping, galvanized, and is consequently unbreakable and rust-proof. Its quick removal and replacement is assured.

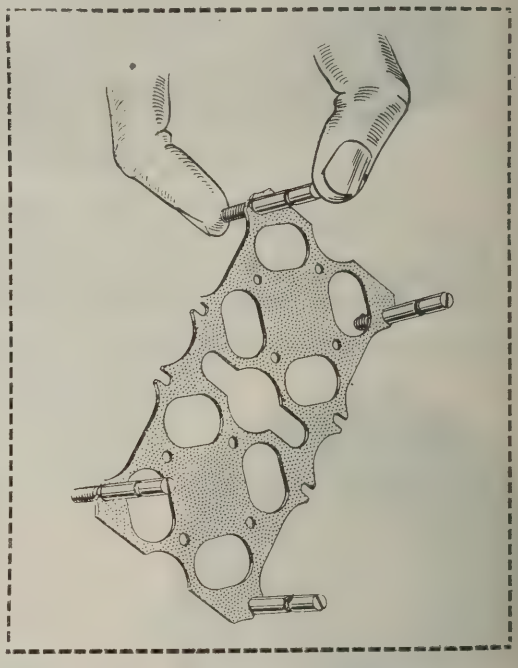

Illustration showing grid removed from box. Adjusting Screws cannot become detached.

CORNER FIXING ARRANGEMENTS.

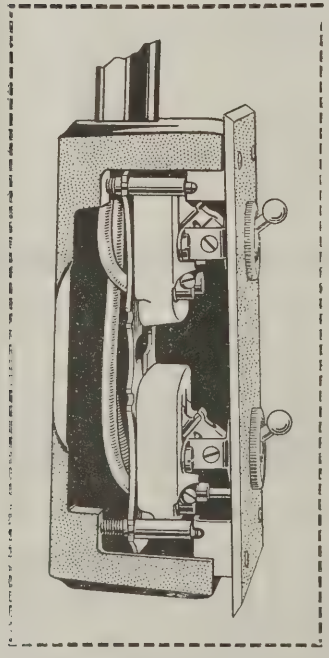

Illustration showing Switchplate fixed with corner fixing screws.

Hitherto, great trouble has been experienced in fixing the switchplate with corner fixing screws owing to the "tilt" of the plate, and the resulting difficulty of engaging screw threads in the tapped holes of the box.

In the Tucker adjustable grid boxes this has been overcome by a special patented feature, whereby the tapped holes to receive the fixing screws are located in brackets attached to the adjusting screws. These brackets are consequently always parallel to the Switchplate, rising and falling with the adjustment.

Descriptive Folder No. S.1, complete with prices, will be gladly sent on request.

Public lighting connection, showing the spare insulator for a switch wire in the event of street lighting being required.

Special guarding arrangements at Blofield Road. The "cage" consists of bare copper horizontal wires in line with the split neutrals.

A run of poles on the roadside. Note how the poles are tucked away by the gateways.

Lighting Schemes

The illustrations show views of the village lighting and power scheme at Brundall, Norfolk, which serves the parishes of Brundall, Blofield and the surrounding areas.

The Main Cables are laid underground from Norwich, the current being distributed by overhead bare copper wires carried on wooden poles. The length of the main overhead line is about 1½ miles.

Henley's were responsible for the overhead work, transformer house, switchboard, etc., the Consulting Engineer being Mr. G. T. Redgment, of Norwich.

Henley's have unique experience in the electrification of town and country areas and are able to carry out schemes of any magnitude—overhead or underground.

THERE IS PROFITABLE BUSINESS for YOU in "EVERAY" & "ICALL" Electro-medical Apparatus

THE remarkable curative properties inherent in Violet Rays are responsible for the ever-growing demand for High Frequency Instruments generally, and "EVERAY" particularly, which are recognised to be the most reliable instruments on the market.

THE illustration depicts "Type B" Portable Apparatus for Universal Voltage. This model is most popular with the medical profession on account of its efficiency and reliability. The retail price is £6 6s.—a most generous trade discount is allowed to all *bona fide* traders.

PROGRESSIVE Electrical Engineers are taking full advantage of the business possibilities in the public demand for these high-grade instruments, and their increasing sales throughout the world testify to their great commercial value.

TUCKER TELAC

Why

THE TUCKER B4000

is

SOUND

ELECTRICALLY *AND* MECHANICALLY

COMPLETE POSITIVE ACTION

It will be seen from the illustration that the contact arm is *positively* and *mechanically* controllable throughout its entire stroke, by the movement of the "dolly" and is not fundamentally dependent on the spring, which is therefore called upon to act in the proper capacity of a spring, i.e., as an accelerator and not as a prime mover.

EXCEPTIONALLY LONG BREAK

The load breaking abilities are exceptional —the "break" being longer than in any switch of a similar type.

The standard 5 ampere single pole switch has successfully dealt with a load of 33 amps. at 250 volts, and with its normal rated current of 5 amps. at 525 volts,

on independent tests.

HIGH INSULATION VALUE

15 AMPERE SIZE.

Otherwise of the same general design and construction as the 5 ampere size the 15 amp. is fitted with and the actual contact arm mounted upon a solid insulator of Mica and Steatite—giving a very high insulation value.

KINGS Rd TYSELEY BIRMINGHAM

CONTRACTORS' COLUMN.

(These particulars of new building schemes are published for the use of contractors and others in search of possible electrical business. Every care is taken by our correspondents to ensure accuracy; if alleged errors are reported to the Editors they will be fully investigated.)

ASHBY-DE-LA-ZOUCH.—Additional 40 houses, for the R.D.C.; surveyor.

AUDENSHAW (Manchester).—Re-erection of hat works, Stamford Road, for Robert Fox & Co.

BARGOED.—Re-erection of by-product plant, for the Powell Duffryn Steam Coal Co., Ltd. (£20,000).

BARNSLEY.—68 houses, Carlton site; Clarke & Squire. New hotel, Cliffe Cross; Barnsley Brewery Co. Housing scheme, Worsborough site; borough engineer.

BEDDINGTON AND WALLINGTON.—Housing scheme (40), Beddington Corner, for the U.D.C.; surveyor.

BEDWAS.—Housing scheme (40), Machen, for the U.D.C.; Idris Leyshon, architect.

BIGGLESWADE (Beds.).—Housing scheme (90), for the U.D.C.; T. R. Howitt, surveyor.

BIRKENHEAD.—Kinema, Bidston Avenue; T. T. Rees, architect. Housing scheme (22), for the T.C.; Charles Brownridge, borough engineer.

BLANTYRE.—Child welfare centre and health institute, with electrical work, for Lanarkshire C.C.; P. C. Smith, District Offices, Hamilton.

BOURNEMOUTH.—Church, Wooton Gardens; trustees. Shops, offices and bank, Wimborne Road; H. C. Barnes. Fire station, Wimborne Road; borough engineer.

BRADFORD.—12 combined shops and houses at No. 3 Bradford Moor housing scheme; city architect.

BRENTWOOD.—Girls' high school, with electrical work, for Essex E.C.; J. Stuart, county architect, Springfield Old Court, Chelmsford.

BROMLEY (Kent).—Administrative block, isolation hospital, for the Bromley and Beckenham Joint Hospital Board; A. B. Coomber, clerk

BUSHBURY (Staffs.).—Works, Fordhouses, for the Uniflo Pump Co.

CAERPHILLY.—Housing scheme (48), Nantgarw, for the U.D.C.; B. Jenkins, housing officer.

CALDAY GRANGE.—Schools (£22,625), for Cheshire E.C.; F. A. Browne, county architect, Chester.

CANNOCK.—Additional 58 houses, St. John's estate, for the U.D.C.; S. Harrison, architect.

CARLISLE.—Estate scheme, Upperby Road; Harrison Bros.

CLARKSTON.—Secondary school; Renfrewshire Education Authority.

COVENTRY.—Residential school, Corley, for the borough E.C.; F. Smith, clerk.

CROMPTON (Lancs.).—Additional 48 houses, for the U.D.C.; surveyor.

DONCASTER.—Premises and showrooms, for C. H. Pickles, Ltd., Leeds; Hustler & Taylor, architects, Pontefract.

DORCHESTER.—26 houses; C. W. Pike, for Corporation.

DOUGLAS.—Extensions, mental hospital, for the Isle of Man Asylums Board; J. E. Teare, architect, 46, Athol Street.

DUMFRIES.—Housing scheme (98), Cresswell, for the T.C.; John Barker, burgh surveyor.

EAST KILBRIDE.—School extensions, Hairmyres Colony, with electrical work, for Lanarkshire E.C.; P. C. Smith, District Offices, Hamilton.

ECCLES.—Housing scheme (68), Edison Road, Patricroft, for the T.C.; borough surveyor.

EDINBURGH.—New mining school (£23,500); clerk, George Heriot's Trust, Edinburgh.

ELY.—Housing scheme (50), for the R.D.C.; H. F. Wykes, architect, Downham Road.

ETON.—Houses (50), for the U.D.C.; Lacey & Sons, builders.

EXETER.—Houses (114), for staffs, for Devon C.C.; county architect.

FARINGDON.—Girls' schools, for Berkshire E.C.; W. C. F. Anderson, secretary, Shire Hall, Reading.

FARNBOROUGH (Hants.).—Kinema, Camp Road, with electrical work, for Charles Darby; Robert A. Briggs, architect, Shripney, Bognor, Sussex. Business premises, Alexandra Road, for Oakey & Sons.

FIFESHIRE.—Reconstruction of Newburgh railway station, for L. & N.E. Railway Co., after fire; engineer, Edinburgh.

GILLINGHAM (Kent).—Housing scheme (44), Woodlands site, for the T.C.; borough surveyor.

GLASGOW.—Building in David Street, Mile End; Roman Catholic Church trustees. Picture house at Kilmarnock Road; Albert E. Pickard, theatre proprietor, 101, Trongate. Housing scheme at Tollcross (£40,500), for Corporation; city architect. Church hall in Anderston, for Cranstonhill U.F. Church; the minister.

HARROGATE.—Additional 50 houses, for the T.C.; borough surveyor.

HASTINGS.—Hotel, restaurant, shops, &c., White Rock, for Palace Chambers (Hastings), Ltd.; S. H. Burdwood, architect, 80, George Street, Portman Square, London, W.

HATFIELD (Herts.).—Electric light installation, Parish Church; Parochial Council secretary.

HITCHIN (Herts.).—Housing scheme (70), West Mill Lane site, for the U.D.C.; surveyor.

HOUGHTON-LE-SPRING (Co. Durham).—Additional housing scheme (26), for the U.D.C.; surveyor.

INVERNESS.—Alterations (£3,600), for Woolworth & Co., Ltd.; the manager.

KNARESBOROUGH.—20 houses, for U.D.C., Stockwell Road; S. Blenkhorn, architect, Bondend.

LONDON (Camden Town, N.W.).—Rebuilding "Gipsy Queen," Malden Road; licensee.

(Bermondsey, S.E.).—Rebuilding shops, 188-194, Southwark Park Road, and 145, St. James's Road; Leighton & Higgs.

(Camberwell, S.E.).—Flats on site off Champion Park; R. W. K. Goddard.

(Eltham, S.E.).—Additional 500 houses, Well Hall, for Woolwich T.C.; borough surveyor. Schools, Well Hall estate, for the London Education Committee.

LONDON—*continued*.

(Woolwich, S.E.).—500 houses, Eltham; borough engineer.

(Fulham, S.W.).—Buildings, corner of Broughton Road and Bulow Road; Loud & Western, Ltd.

(East Ham, E.).—38 garages, Flanders Road; S. H. Anstead. Extensions, electricity works, Elizabeth Road; Dawson, Son and Allerdyce. Store, High Street Market; L. G. Elkins. Forty houses, Central site; borough engineer. 30 houses, Central Park Road; F. Hamlett. 44 houses, Charlemont Road; R. Cheke and Co. (Wanstead), Ltd.

LUTON.—Shops and showrooms, George Street; Hillier, Parker, May and Rowden. Ten houses and shops, Dunstable Road, for J. Frost.

LYE.—Additional 52 houses, Brook Crescent estate, for the U.D.C.; H. E. Folkes, surveyor.

LYTHAM-ST. ANNES.—Girls' secondary school, for the governors of Lytham School Charities; the clerk.

MACCLESFIELD.—Board room and offices (£4,600), for the R.D.C.; G. Clayton, architect.

MANCHESTER.—New Masonic temple; R. V. Clayton, 2, Cooper Street.

MERTHYR TYDFIL.—Additional 52 houses, Heolgerrig, for the T.C.; borough architect.

NEWCASTLE.—26 houses, Wharrier estate. 34 houses, Walker estate; G. G. Carr. 230 houses, Walker estate; H. Kelly (Contractor), Ltd.

NORTHAMPTON.—Electric lighting installation, Clare Street headquarters, for Northants. Territorial Army Association; Major J. A. C. Wetherall, secretary.

NORTON (Yorks.).—Schools, for West Riding E.C.; F. A. Darwin, clerk, County Hall, Wakefield.

OTLEY.—Extensions, Atlas Works; Dawson, Payne & Elliott. 56 U.D.C. houses, Harefield estate; Council surveyor, North Parade.

PAISLEY.—New premises for Paisley Savings Bank; the manager. Dance hall, tea lounge, &c., for Paisley Plaza, Ltd., 114, West Campbell Street, Glasgow; the secretary.

PETERBOROUGH.—Headquarters, for the Northants. Territorial Army Association; J. W. Fisher, architect, Burystead Place, Wellingborough.

PLYMOUTH.—44 garages, showrooms, workshops, &c., Stuart Road, Penny Comequick; W. Reed. Estate scheme, Lower Compton; H. J. Hammick.

PONTEFRACT.—New hotel at Upton, for Wm. Pickersgill & Co., Ltd.; Garside & Pennington, architects, Ropergate.

POOLE.—Garden village scheme, Wallis Down, for a local syndicate; particulars from the Mayor, Alderman H. S. Carter.

RICHMOND-ON-THAMES.—Housing scheme (63), Manor Road estate, for the T.C.; borough engineer. Extensions to Greyhound Hotel; Brewer, Smith & Brewer, architects.

ROMFORD.—Houses (20), Pettits Lane, for H. J. Finch. Houses (18), Collier Row Lane, for Limbert & Walker.

RUNCORN.—Houses (21), Cornwall Street, for W. H. Davey & Co., Ltd.

RYHOPE (Co. Durham).—Extensions to Parish Church (£4,300); Hicks and Charlewood, architects, Newcastle-on-Tyne; A. Pringle, Ltd., builders, Gateshead.

SALFORD.—Secondary schools (£25,000), Weaste Lane, Pendleton, for the De la Salle Roman Catholic College; the principal.

SHANKLIN (Isle of Wight).—Municipal offices, for the T.C.; E. C. Cooper, architect, Post Office Chambers.

SOUTHAMPTON.—Extensions to University College, for the Council; the registrar.

SOWERBY.—Extensions to New Road schools (£5,000), for West Riding E.C.; Director of Education, County Hall, Wakefield.

SPALDING.—Kinema; Percy L. Brown & Son, architects, Newcastle-on-Tyne.

STAFFORD.—Housing scheme (52), Tithe Barn estate, for the T.C.; W. Plant, borough engineer.

STARCROSS.—Colony for defectives; Plymouth Corporation and joint authorities.

STORNOWAY.—Reconstruction of municipal buildings and library, for the T.C.; J. G. Chisholm, architect, 15, Union Street, Inverness.

STRETFORD.—Church, for St. Cuthbert's, Third Avenue; Robert Martin, architect. Dance hall, Chester Road; J. Hayes. 38 houses, off Barton Road; J. W. Maunders. Baths, Trafford Park; U.D.C. surveyor. Proposed 340 houses, Trafford estate; U.D.C. surveyor.

STUBBINS (Ramsbottom).—New St. Philip's Church; Robert Martin, architect, Deansgate, Manchester; Leonard Clough, Ltd., builders, Adlington, Chorley.

SWANSEA.—Church hall, Cwm Level Road, Landore; Rev. T. Harrington. Additions, Horeb Congregational Church, Morriston; trustees. Estate development, Trigwl Farm, St. Thomas; E. R. Griffiths, architect for Grenfell Estate Co. Remodelling old Waverley Hotel premises, Cradock Street; Blewitt, Jenkins & Son. IMPORTANT ANNOUNCEMENT

by the

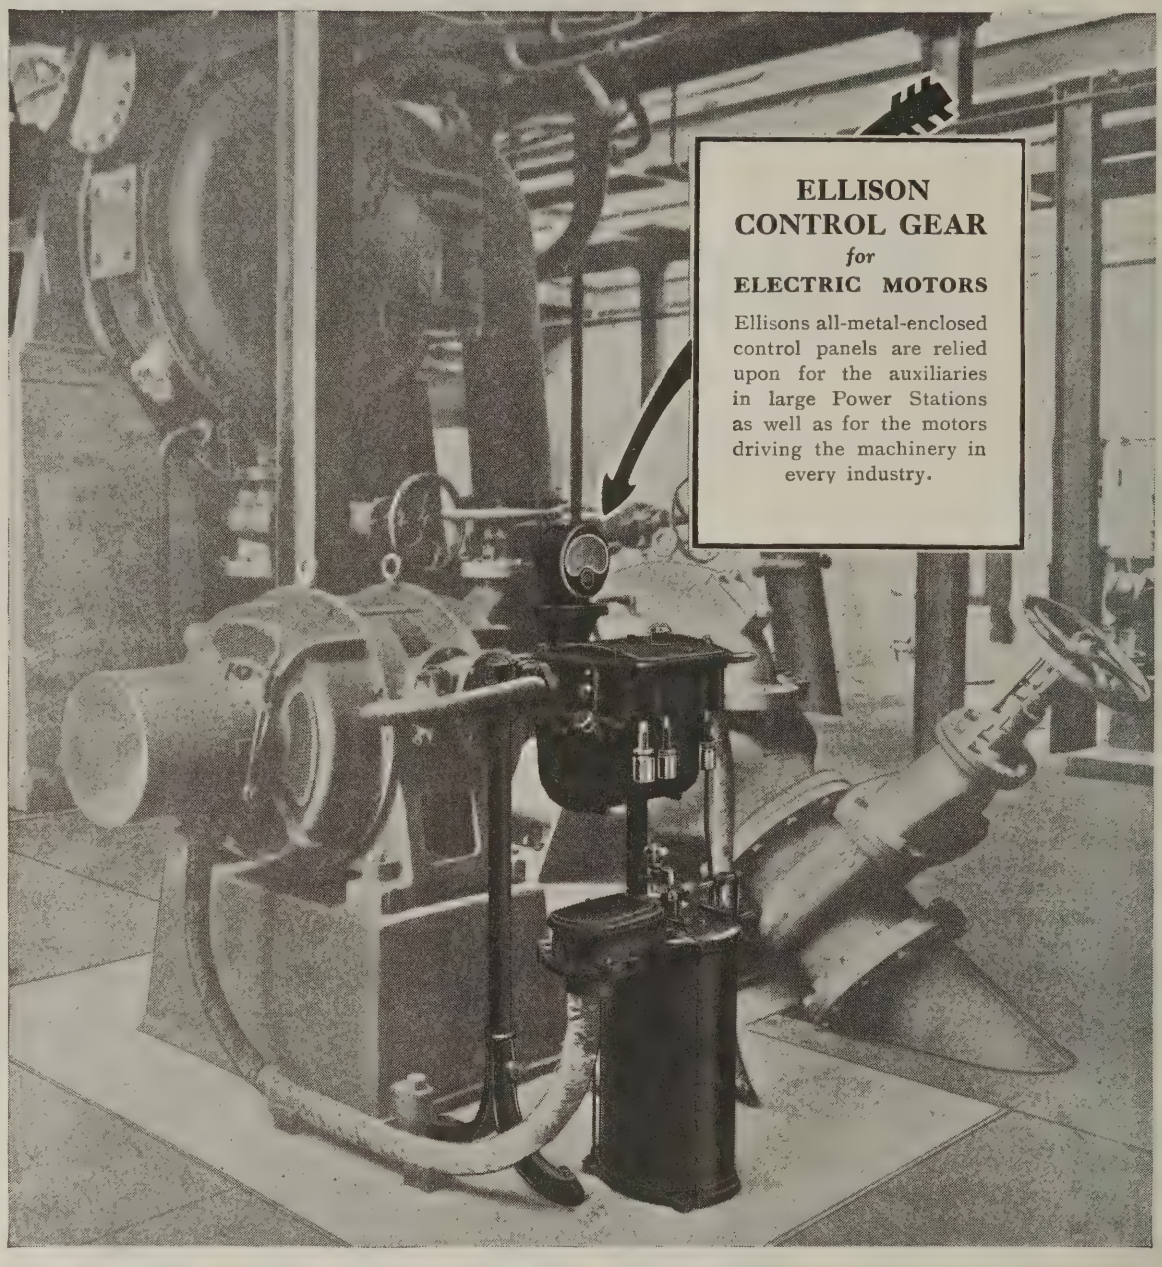
CABLE MAKERS' ASSOCIATION.

The term **"Non-Association"** was introduced by the Cable Makers' Association in 1905 to distinguish cables of the second quality from the **"Association Grade"** (first quality) Cables of its members. For some time it has been urged upon the C.M.A. that the description is being applied by manufacturers at Home and Abroad who are not members of the Association, to their own cables, which are sometimes of inferior quality. This has caused confusion and possible loss to buyers of electric cables, and it is felt that some definite distinction is necessary.

Buyers of Electric cables will, therefore, be glad to know that the Registrar of Trade Marks has recently registered in the name of the **Cable Makers' Association,** as a new Trade Mark the word

NONAZO

Registered No. 458865.



After March 31st, 1926, this registered Trade Mark will be introduced on the labels of "Non-Association" Class Cable made by all members of the Cable Makers' Association.

The Geyser Load

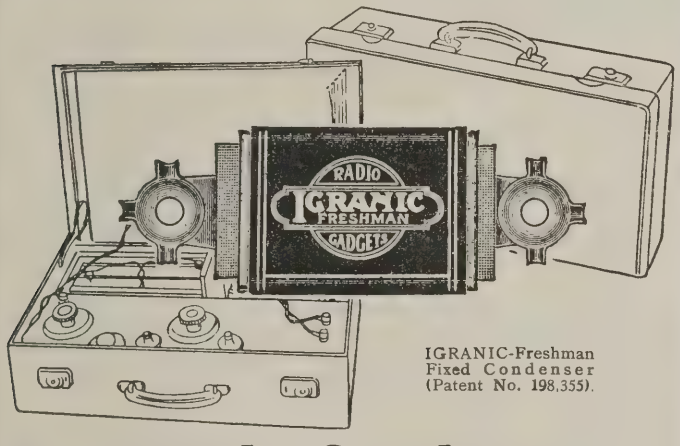
is better than a

Cooker Load

inasmuch as a Geyser fixed in a scullery is IN USE ALL DAY.

The **Santon Geyser** is a fitment which appeals to the consumer because of its low price, simplicity and absence of maintainance costs. It appeals to the **Supply Engineer** because of the very desirable DAY LOAD it provides.

NO VEXATIOUS BREAKDOWNS.



£6 - 6 - 0
(Guaranteed 12 months).

Hire them out to your consumers

for use in Sculleries. It is the ideal place for a Geyser from all points of view.

Ask for particulars of our 2-Heat Geyser. Load switched on in two stages, (OFF-1-2-1-OFF).

SANTON LIMITED,
Manufacturing Electrical Engineers,
34, Bridge St., NEWPORT, MON.

IGRANIC-Freshman Fixed Condenser (Patent No. 198,355).

A Fixed Condenser— in the Truest Sense

The Igranic-Freshman is a *fixed* condenser in the truest sense. No matter what the climatic conditions may be, its capacity will always be within 5% of nominal value. This is a strong selling point during Summer-time when sets go into the open air. The method of assembling the Igranic-Freshman Fixed Condenser rigorously excludes moisture and dust, and prevents the losses which result in indifferent reception when unreliable fixed condensers are used. Nine capacities are available, the smaller ones retailing at **2/-** each, and the larger at **2/6.**

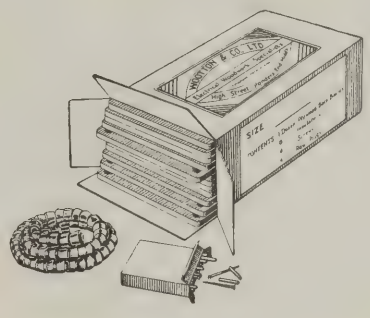
DRASTIC PRICE REDUCTIONS IN METER BOARDS.

The considerably increased demand for Wootton Meter Boards has enabled us to make drastic price reductions through lowered production costs. At the new prices these boards positively represent the best obtainable.



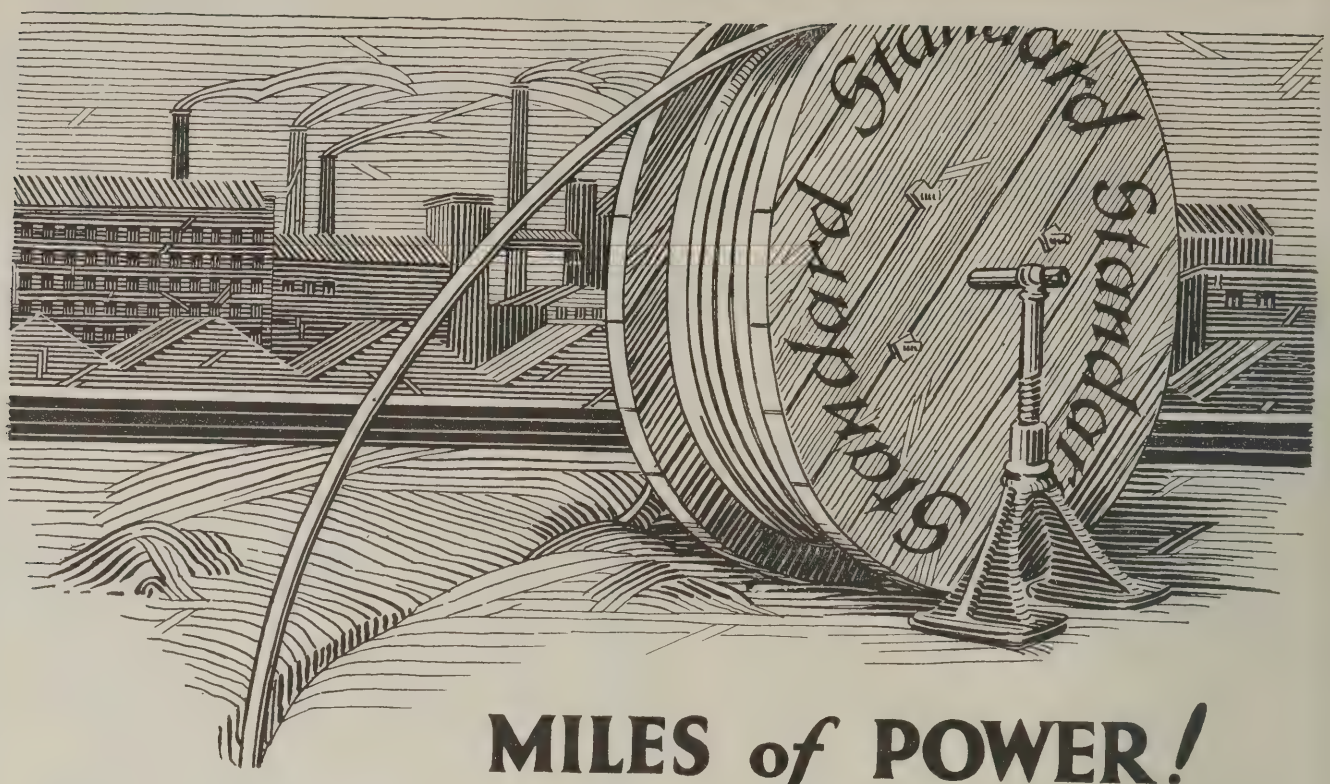
Type "A1." Plywood with Battens.

First quality 12½" m/m 7-ply Birch (approx. ½" thick), Two 2" × ⅞" Yellow Deal Battens, screwed on back on shortest side. Varnished ALL OVER two coats best Shellac; front finished French polish.

Type "B." Plywood.

First quality 12½" m/m 7-ply Birch (approx. ½" thick), round corners, varnished ALL OVER two coats best Shellac. No battens; each board supplied with eight Porcelain Insulators, four 2¼" × No. 10, Iron Screws, and four 1½" Rawlplugs to suit.

Any size made. Write NOW for PRICES.



Type "B" Meter Board is supplied in Millboard Cartons convenient to stock and ready for use. Each carton contains: 12 Plywood Backboards (½" thick), each board protected by greaseproof paper. 96 Porcelain Insulators, 48 screws, 48 Rawplugs.

IMPROVED

Feeder Pillar Casings.

N.B.

Please give us your enquiries for odd sizes whether taller or shorter or

N.B.

with divided up interiors, &c., &c., also for Doors and Frames for Brick Chambers.

No. 1326. Registered Design.

We have brought out this excellent Feeder Pillar in the **seventeen** standard sizes as set out below in order to meet all ordinary requirements.

These Casings are of very nice appearance, are made up of thoroughly good castings, and are very efficiently ventilated. Each Pillar is provided with doors, hung on massive ornate malleable iron hinges pivotted on ⅜ in. dia. Brass Pins, and each door is fitted with a good Brass Lock. Sizes up to and including Size 4 have their door openings closed in by single doors, the openings in the larger sizes being closed in with multiple doors. The underground root part of all sizes measures 15 inches high and can be made detachable at a reasonable extra.

YOUR ENQUIRIES SOLICITED.

HARDY & PADMORE, LIMITED,

ONLY ADDRESS: WORCESTER, ENGLAND.

By courtesy of Messrs The Dorland Agency Ltd., London.

Laboratory illustration showing how Firefoam, generated by Foamite equipment, instantly smothers fire by blanketing the burning surface and so shutting out air. Inflammable liquids float upon water but Firefoam floats upon inflammable liquids. After a fire is out, Firefoam dries and may be brushed or washed away. There is no dripping or soaking through which is experienced with water or liquid chemicals.

None but the best was good enough

The completed wing of the new Dorland Agency building is equipped with Foamite appliances.

The mistaken belief that all fire extinguishing methods are the same has lost hundreds of lives and millions in property.

That is why leaders in industry now call upon specialists to ensure that *the right fire protection is installed in the right place.*

Backed by a company manufacturing every type of first-aid fire appliance, Foamite Fire Protection Engineers are able to prescribe scientific safeguards for every kind of fire hazard.

Liquid—or Gas—or Foam

Water is effective upon ordinary fires. So are soda acid extinguishers, like the "Firespray," which discharge mostly water. But liquids are generally useless on oil fires—petrol fires—paint fires.

Gas, as formed by carbon tetrachloride from an extinguisher like the "Fire-Gun," has a distinct place in fighting certain types of fires. How often, though, are such devices used upon fires which they can *not* extinguish!

The foam method of smothering fire under a blanket of tough, clinging bubbles called Firefoam, is effective upon practically every type of fire. Not only does Firefoam instantly kill ordinary fires, but it is the only dependable method of extinguishing highly inflammable liquids. Yet even this method needs expert adaption to certain special risks.

Foamite representatives are always ready to *demonstrate*, upon request, the form of protection best suited to your particular hazard.

Send for a free copy of the booklet entitled "Extinguishing Oil and Other Fires," which describes the road to freedom from uncontrolled fire.

FOAMITE FIREFOAM, LTD.,

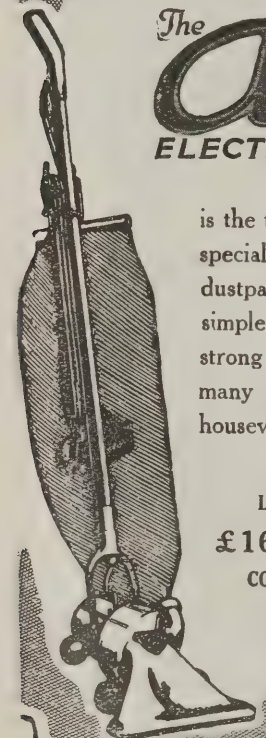
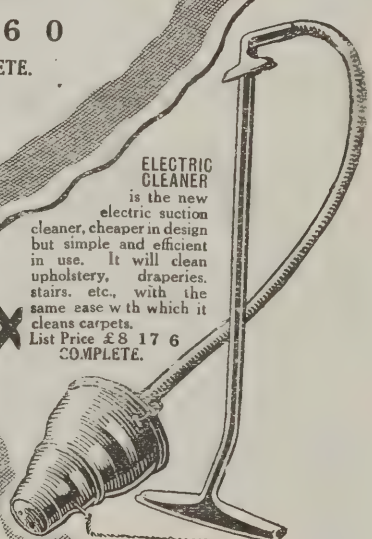
Facts that make Sales grow

Devices that reduce labour in the home are more in demand now than ever they were, and there is always big business waiting for the dealer who is able to show his customers appliances of first rate quality and moderate price.

The lines described below are all high-class productions. They have an extremely low current consumption. They are easy to use and to understand.

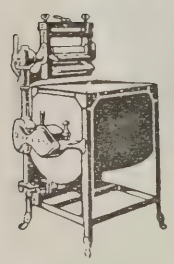


Best of all, they're extremely easy to sell, and show a handsome profit on every sale.



The Apex ELECTRIC SUCTION CLEANER

is the thorough cleaner. The special nozzle shaped like a dustpan, the sensible handle, simple lubrication and the strong motor are a few of many good points that the housewife will appreciate.



List Price
£16 16 0
COMPLETE.

ROTAREX

ELECTRIC CLEANER is the new electric suction cleaner, cheaper in design but simple and efficient in use. It will clean upholstery, draperies, stairs, etc., with the same ease with which it cleans carpets.
List Price £8 17 6
COMPLETE.

ELECTRIC WASHING MACHINE.

Washes safely, gently and efficiently all kinds of clothes. A perfect washing machine for home use without troublesome fittings and contrivances. The new model has all aluminium cylinder and wringer.

Write for full particulars of these and other profitable lines.

SHOCKING!

is impossible when J.C.W. Hand-lamps are used, because their non-hygroscopic, non-softening, fire-proof insulation is shock-proof. And now Fire Offices have adopted I.E.E. regulations, with which J.C.W. Hand-lamps fully comply. No earth wires. No leaks. No shocks. Lamp cap, terminals, and holder totally enclosed, and a sheathing grip to rely upon.

Our range of eight patterns covers everything you need. Send for list.

Fusing Problems Solved!

"The Special Cartridge Fuse."

Aeroflex HOPE'S PATENTS

"The Special Cartridge Fuse."

TRACTION FUSES

Readily—Rewireable.

500 times full load current!

TESTS CARRIED OUT AT THE NATIONAL PHYSICAL LABORATORY

:: *May 1st, 1925,* ::

:: ON TWO 30 AMP. ::

"AEROFLEX" TRACTION FUSES.

Tests were made with direct current, the source of supply being a battery giving 600 Volts. The resistance of the circuit was adjusted so that the current should rise to a maximum value of 15,000 amps.

RESULT.

The Cut-outs opened the circuit cleanly without damage to any part, the only apparent change was a very slight warning of the container.

BECOL

REGISTERED TRADE MARK.

EBONITE

SUPPLIED IN

RODS, TUBES, SHEETS, MOULDINGS, PUMP RINGS, ACCUMULATOR BOXES, Etc.

"BECOL" EBONITE PANELS for WIRELESS.

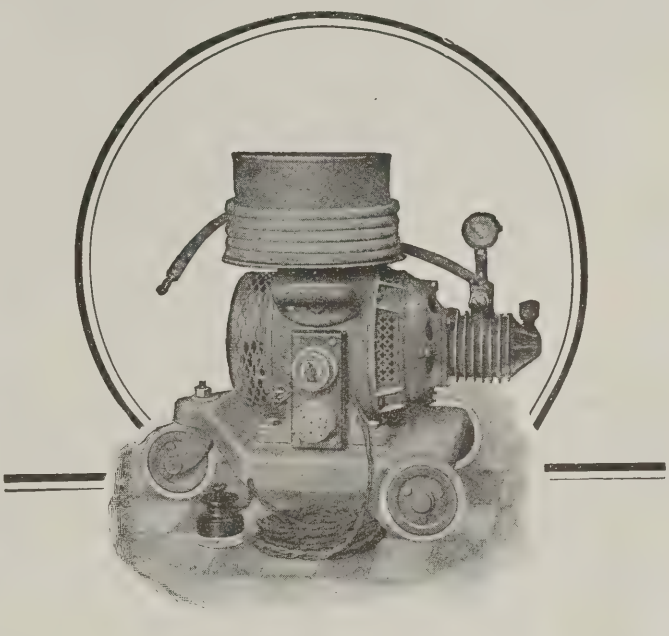
VULCANITE

Prompt deliveries FROM STOCK and TO ORDER.

Full particulars, Trade Terms and List "D" on request.

THE BRITISH EBONITE CO., Ltd. Factories and Offices: Hanwell, London, W.7. Telephone: Ealing 1560

"Moonstone"



Bowls, Shades, and all fancy Patterns in Stock.

Fittings Catalogue on application

Underwood (Manchester), Ltd.,
53, Brown St.,
Manchester.
'Phone: 6750, Central (2 Lines)

Lamps, Cable, Switchgear, Vacuum Cleaners, Fires, Fans, Motors.

& all Electrical Accessories at best Trade Prices.

The REAVELL

"SUBSTATION" SET

FOR BLOWING DUST FROM ELECTRICAL MACHINERY

EASY PORTABILITY—It weighs only 150 lbs. complete with wheels or 115 lbs. if supplied with lifting handles only.

EXTREME COMPACTNESS—It occupies a floor space only 2 ft. × 1 ft. 5 in Height, 1 ft. 9 in.

Send to Department "D" for full particulars.

REAVELL & CO., LTD. - IPSWICH.

INSPECTION & INSURANCE OF ELECTRICAL PLANT.

BRITISH ENGINE, BOILER & ELECTRICAL INSURANCE Co., Ltd.,

24, Fennel Street, Manchester. 56, Kingsway, London, W.C. 2.

Surveyors Resident in Principal Towns.

A Logical Suggestion!

Porcelain is the best Insulating Material—

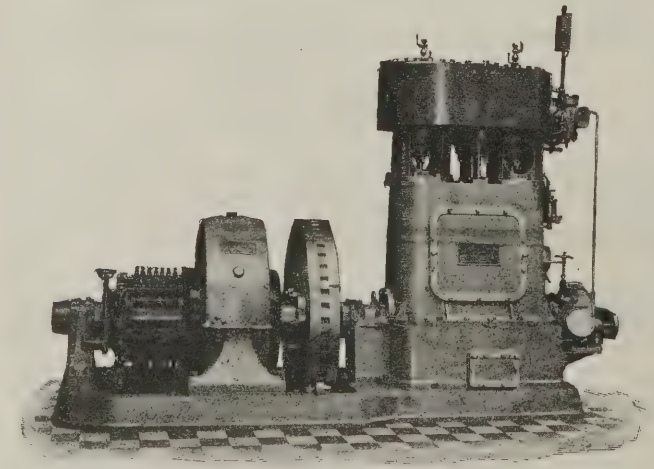
"Macintyre's" is the best Porcelain—

Therefore—use "MACINTYRE" Porcelains—

well-known throughout the Industry for

ACCURACY, EFFICIENCY, STRENGTH AND GOOD FINISH.

JAMES MACINTYRE & Co., Ld.



Washington Works,

BURSLEM.

W. H. Allen, Sons & Co., Ltd.

BEDFORD — ENGLAND.

Back-Pressure STEAM ENGINES For POWER and PROCESS WORK.

150 K.W. Steam Engine and "Allen" D.C. Generator arranged for Back-Pressure Exhaust.

Forced Lubrication,

Simple or Compound Types.

SUITABLE FOR

Direct Coupling to:

A.C. or D.C. GENERATORS

Centrifugal Pumps and Fans, etc., or for Belt or Rope Drives.

THE BETTERWAY

Dining-room Pendant.

SERIES "I."

This Pendant is complete with Ceiling Plate and Chains.

The Flounce hangs perfectly; the White Silk Lining and Bead Trimming give it that "well made" appearance.

FOR ELECTRIC.

SERIES "I."

COLOURS:

L.P.S

ENAMELLED COPPERWIRE

It is significant that the weekly output of L.P.S. Enamelled Wire is far and away greater than that of any similar wire on the market. This is proof in the first place of its superiority (L.P.S. Wire is especially notable for great consistency of insulation and for perfect reeling). It also means that on account of its enormous turnover L.P.S. Wire can be profitably marketed at a price considerably lower than that of its rivals.

ENQUIRIES ALSO INVITED FOR

Insulating Varnished Silk, Cloth, Paper and Tapes (bias and straight cut). Insulating Tubing, sizes from ⅛ m/m to 50 m/m bore. Bakelite in sheets, rods, etc. Presspahn, Leatheroid, and Fibre.

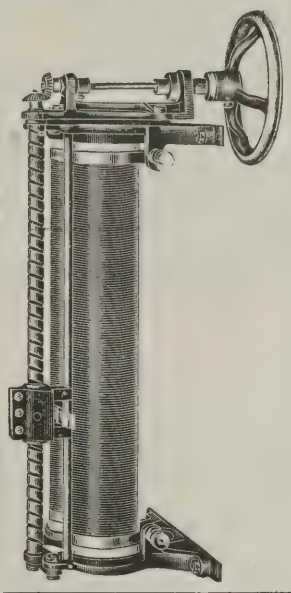
Why not sell the "Super Tone"?

CUSTOMERS now no longer buy "any old loud speaker." It is *tone* that matters in wireless now . . . and the Ericsson Super Tone has forged ahead on *tone*. Made by a firm with a generation's experience in telephone manufacture what else could follow?

18" high, on handsome wood base—a good-looking instrument for your counter or window. Retails at 63/-.

The Junior Super Tone is an excellent instrument for medium-sized rooms. Retails at 32/6 complete with lead.

Write to-day for terms, which are generous.



Ericsson Telephones Limited,
67/73, Kingsway, London, W.C.2

We also make the famous Super Sensitive Ericsson Headphones, 2, 3 and 4 Valve Sets, Transformers, Condensers, Rheostats, etc. Write for lists and terms.

ZENITH

REGULATING RESISTANCES

Back of Board Type for Field Regulation, etc.

Simple construction

Ample rating

All mechanical parts entirely insulated

Reliable and easy to fix

Enable extremely fine regulation to be obtained

Single and Double Tubular types are manufactured in 10 sizes

Front of Board Indicators showing position of slider at any point can be supplied.

Wherever Resistances of any type are required, always insist on ZENITH productions

RELAY

AUTOMATIC TELEPHONES

ARE USED BY

The Head Offices and Works of Studebaker, Limited, Willesden, London.

STUDEBAKER, LIMITED

They write:

"WE have found the 'Relay' telephone system installed in our London Works very efficient. Its use enables communication between our many Departments and administrative offices to be effected with a promptitude essential to an organisation of the size and activity of the Studebaker."

RELAY FEATURES:

Through in 3 seconds—and the right number every time. Day and night service—no operators—secret. Unaffected by climate. No oiling nor cleaning. Only two wires to each instrument. No mechanical switches to go wrong—cannot wear out. System built entirely of relays having maximum movement of 1/32-inch and heavy pressure between contacts.

Write for Booklet No. 3.

THE RELAY AUTOMATIC TELEPHONE CO., LTD.,
Marconi House,
Strand, London, W.C. 2.
Telephone: City 0281.

Branches at Birmingham, Cardiff, Glasgow and Manchester
Representatives all over the world.

BRITISH GOODS ARE BEST—THE "RELAY" AUTOMATIC TELEPHONE SYSTEM IS ALL-BRITISH.

FIRE EXTINGUISHING LUX WITHOUT DAMAGE.

DRY GAS FIRE SYSTEM

LUX permits of the rapid release of large quantities of Carbon Dioxide and is the modern and positive method of fighting electrical fires in

GENERATORS, CABLE TRENCHES,
TRANSFORMER, and OIL SWITCH ROOMS,
SWITCHBOARDS, ETC.

NOT BRITTLE

Thin "ELO" Mouldings may be dropped from good heights on to concrete floors without damage.

The strength of "ELO" mechanical and dielectric is unsurpassed in any other form of insulating material.

30/40,000 volts, A.C., on ⅛ thickness and 4/5,000 lbs. per square inch on ordinary grades are the figures. Special grades can be made to take any required strain.

'ELO'

SYNTHETIC RESIN PRODUCTS

The principal forms in which "ELO" is made are Finished Mouldings, Varnish Resin and Moulding Powders. All have the same valuable characteristics. Further particulars on request.

PULVERISED COAL FIRING PLANT

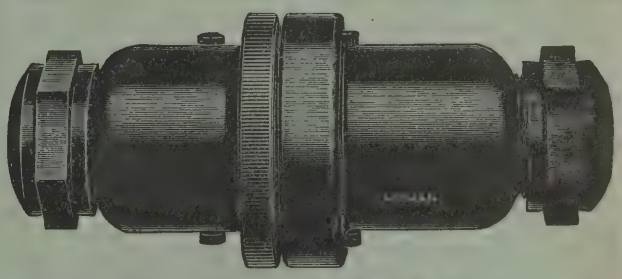
Central Plants or Unit Type Apparatus to suit conditions

BOILERS SPECIALLY DESIGNED WITH WATER-COOLED COMBUSTION CHAMBERS

GIVING THE FOLLOWING ADVANTAGES :—

1.—Long life to brickwork and low maintenance costs even when overloaded and with minimum excess air.
2.—Complete and instantaneous combustion of coal particles due to radiant inner surface of chamber.
3.—Maximum efficiency since radiation losses are reduced to a minimum.

THE FOUR LARGEST BOILERS IN THE KINGDOM



each to give 180,000 lbs. steam per hour are being built with

The Silvertown Inert Cell

remains inactive until water is added, after the absorption of which it becomes practically a dry cell.

The great advantage it possesses is that it can be kept in stock indefinitely without deterioration.

For this reason the Inert Cell is particularly suitable for use abroad, in places where dry cells are affected by the climate.

We make all types of Primary Batteries. Write for List No. 31.
